Generic Category	Abattoirs
CG Code	STS001
Specific	Meat Processing Facility
Descriptive	Single storey meat processing factory with mezzanine offices.
Tech1	Over 500m2
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£1,756
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Concrete foundations and slab; metal/concrete upper floor. Timber stairs. Steel frame, roof and wall cladding. Facing brick/block walls. Double glazed aluminium windows. Block partitions. Flush doors. Plaster and tiles to walls; carpet, quarry tile and cementious polymer flooring; plasterboard and suspended ceilings. Fittings. Abattoir and hygiene equipment. Floor drains and disposal. Includes prime cost sum for heating, electrics, sanitary ware and wash-down system; refrigeration and air conditioning. Loading dock.
Referencing details	-
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	Hoardings - Freestanding - Timber. Typically the construction comprises a metal or plywood faced signboard with painted softwood frame surround, mechanically fixed to vertical metal stanchions set into concrete pad foundations. Freestanding hoardings (excluding lighting). An advertising hoarding is a large outdoor signboard found in places with high traffic such as cities, roads and motorways, aiming to show large advertisements to pedestrians and drivers. Some supports are wholly timber with stays, but the difference in cost compared to steel stanchions (which require no stays) is not significant. The size of hoardings directly relates to the number of Crown Posters they can display. The dimensions for a Crown Poster are 412.8 x 533.4 mm.
Referencing details	Number of sheets or dimensions.
Cost information notes	Costs as per non-illuminated. Price includes supply, installation and delivery charges. Add for planning application fee.

ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	For site difficulties - limited access such as a traffic island or over 5.0m above ground level add 2.5% to cost.

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Ultravision display screen - NOW OBSOLETE. Priced as modern day equivalent. Outdoor digital screen, weatherproof and vandal proof casing. Commercial grade within a metal box with in-built ventillation. Concrete pad foundation. To date only 48 page posters have been known to be installed freestanding.
Referencing details	These panels are usually found in cities in prominent locations.
Cost information notes	Ususally used on displays 6 sheets or above. Upgrade to cloud network media player (wifi / Lan), for wall mounted tabletuse code 60A00V4. Traffic management for road side installation use code 60A00V5. For lighting see "Display Lighting". For items such as platforms and walkways see Stairs and Walkways.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	For site difficulty - limited access such as a traffic island or over 5m above ground level - add 2.5% to cost.

Generic Category	Agricultural Buildings
CG Code	50A00X
Specific	Flat Grain Store
Descriptive	Steel portal frame, walls clad with sheet metal profile cladding and concrete thrust (push) walls, roofs clad with cement fibre roof sheets. Roof may incorporate transluscent roof lights
Tech1	500m²
Tech2	Eaves Height 6m
Unit size	500m²
Unit of measurement	m2
ERC	£716
Superseded codes	98B031
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Steel portal frame unheated, uninsulated, usually no natural light, walls clad with uninsulated profiled metal sheet cladding and roofs clad with fibre cement sheets, concrete slab floor, may or may not have doors. So that bulk products can be stored to a reasonable height, flat grain stores will have thrust walls (sometimes called grain walls) to a height of approx. 2.50 – 3.65 metres. May have a vented floor to aerate the product, but most have fans in the thrust walls and venting is by means of removable pipes. The manufacturers tend to refer to flat grain stores in terms of their storage capacity, e.g. 1000 tonnes, 2500 tonnes. etc. Can be used in conjunction with vertical grain stores such as silos. See also Rating Manual Valuation Practice - Section 460 Grain Silos and Practice Note - Grain Stores and Grain Silos. Note: Agricultural buildings may have multi-functional uses dependant on the seasons and how the farm is worked/managed.
Referencing details	Measure to GEA, record eaves height. Photograph internally and externally. Referencers/valuers to record all details of adjacent silos/equipment/plant and machinery used in conjunction with the flat grain store. Ascertain additional plant and equipment present such as aerators, temperature and humidity controls. Flat grain stores can be assessed for rating using either the rental method or using contractors method. Reference should therefore be made to the applicable Rating Manual Guidance and Practice Note to determine the correct valuation method to be adopted.
Cost information notes	Cost based on basic steel portal frame construction, clad to walls with single skin uninsulated steel profile sheet,roofs clad with cement fibre roof sheets, typically rectangular in plan, 6m eaves height with basic power and lighting, manually operated roller shutter door and 1no personnel door. For adjustments see also variations. For flat grain stores in excess of 500m² contact BEAMs team for further guidance.
rateable element	Refer to Rating Manual Section 5a Valuation of all Property Classes Grain Stores and silos
non rateable element	See Practice Note - Grain Stores and Grain Silos

Adjusted Plant and Machinery	Silos (Vertical Grain Stores) - May have auto fillers, temperature and moisture control plant, testing equipment, electrical roller shutter doors.
Number of items adjusted	Referencer to ascertain on site number of adjoining items - Refer to Rating Manual and Practice Note.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	For adjustments apply 7% reduction for basic industrial sheds open one long side. Apply 5% reduction or increase for variations in height (1m) from beacon eaves height of 6.0m

Generic Category	Air
CG Code	201A70
Specific	Compressors
Descriptive	Cylinder Mounted 7 Bar
Tech1	Motor hp 0.5
Tech2	1.2 ft^3 / min
Unit size	-
Unit of measurement	Each
ERC	£513
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Cylinder mounted piston air compressor, a machine for compressing air by means of a piston. This is usually electrically driven with the compressor and motor mounted on the air receiver (storage cylinder). Commonly found in car garages and small factories.
Referencing details	1.The Type (cylinder mounted) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care.
Cost information notes	-
rateable element	Class 1 Table 1(i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii)
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Air
CG Code	201A71
Specific	Compressors
Descriptive	Cylinder Mounted 7 Bar
Tech1	Motor hp 1.5
Tech2	3.2 ft^3 / min
Unit size	-
Unit of measurement	Each
ERC	£636
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Cylinder mounted piston air compressor, a machine for compressing air by means of a piston. This is usually electrically driven with the compressor and motor mounted on the air receiver (storage cylinder). Commonly found in car garages and small factories.
Referencing details	1.The Type (cylinder mounted) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care.
Cost information notes	-
rateable element	Class 1 Table 1(i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii)
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit size	-
Unit of measurement	Each
ERC	£29,313
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Piston Air Compressor Air Compressors - Machine for compressing air by means of pistons Usually electrically driven but could be steam turbine or diesel engine driven. This piston compressor is commonly found in medium to large industrial complexes. The storage cylinder (receiver) is located away from the compressor and between the two are usually air filters and air dryers pressures usually 7 Bar or greater. For low pressures this unit may be a single piston. The compressor switches on when the pressure in the receiver is below the pre set figure.
Referencing details	1.The Type (piston) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm generally.
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now genreally being replaced by screw type compressors.

Referencing details	1.The Type (piston) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm generally.
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now genreally being replaced by screw type compressors.
rateable element	Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Piston Air Compressor Air Compressors - Machine for compressing air by means of pistons Usually electrically driven but could be steam turbine or diesel engine driven. This piston compressor is commonly found in medium to large industrial complexes. The storage cylinder (receiver) is located away from the compressor and between the two are usually air filters and air dryers pressures usually 7 Bar or greater. For low pressures this unit may be a single piston. The compressor switches on when the pressure in the receiver is below the pre set figure.

CG Code	201A04
Specific	Compressors
Descriptive	Piston 7.5 Bar
Tech1	134 m^3 / hr
Tech2	79 ft^3 / min
Unit size	-
Unit of measurement	Each
ERC	£5,338
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Piston Air Compressor Air Compressors - Machine for compressing air by means of pistons Usually electrically driven but could be steam turbine or diesel engine driven. The piston compressor is commonly found in medium to large industrial complexes. The storage cylinder (receiver) is located away from the compressor and between the two are usually air filters and air dryers pressures usually 7 Bar or greater. For low pressures the unit may be a single piston. The compressor switches on when the pressure in the receiver is below the pre set figure.
Referencing details	1.The Type (piston) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm generally.
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now genreally being replaced by screw type compressors.
rateable element	Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Rotary Screw Air Compressor Air Compressors - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre set figure.
Referencing details	1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now genreally being replaced by screw type compressors.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Air
CG Code	201A81
Specific	Compressors
Descriptive	Rotary screw 12.5 bar
Tech1	18.5KW
Tech2	139 ft^3 / min
Unit size	-
Unit of measurement	Each
ERC	£21,722
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Rotary Screw Air Compressor Air Compressors - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre set figure.
Referencing details	1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now genreally being replaced by screw type compressors.
rateable element	Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. Description	Rotary Screw Air Compressor Air Compressors - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre set figure.
Referencing details	1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included.
rateable element	Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Rotary Screw Air Compressor - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre set figure.
Referencing details	1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included.
rateable element	Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.

Tech1	Motor kw 120 - 164 hp
Tech2	777 ft^3 / min
Unit size	-
Unit of measurement	Each
ERC	£60,603
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Rotary Screw Air Compressor Air Compressors - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre set figure.
Referencing details	1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now genreally being replaced by screw type compressors.
rateable element	Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Air
CG Code	201A104
Specific	Compressors
Descriptive	Rotary Screw Cylinder Mounted 4 - 10 bar
Tech1	22 kW
Tech2	23 - 130 cfm
Unit size	-
Unit of measurement	Each
ERC	£20,092
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Cylinder Mounted Screw Compressor. Machine for compressing air by means of rotary screws, Usually electrically driven this type of compressor is commonly found in car garages and small factories. The motor and piston are mounted on the storage cylinder (receiver). The compressor switches on when the pressure in the receiver is below the pre set figure.
Referencing details	1.The Type (screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm
Cost information notes	Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now genreally being replaced by screw type compressors.
rateable element	Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors
non rateable element	Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Generic Category	Air
CG Code	201D71
Specific	Dryers
Descriptive	Gas 14 bar
Tech1	20m³/hr
Tech2	-
Unit size	-
Unit of measurement	Each
ERC	£1,329
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Air Dryers are situated between the air compressor and the air receiver. The Air Dryer takes the moisture out of the compressed air. This helps to prevent rust forming in the air receiver and mild steel distribution pipes. There are 3 main types, refrigerant, desiccant and desiccant drum type. Refrigerant dryers are the most common. These units can be a variety of shapes and sizes. For high pressures or where large volumes of air are continuously required the units are larger and more complex in nature. The size of the air dryer is based on the amount of air cu m / hour that is passing through the system.
Referencing details	-
Cost information notes	Costings are based on refrigerant type dryers as desiccant types are less common and slightly more costly.
rateable element	List of accessories 2. (v) coolers, purifying and other treatment apparatus, separators, filters.
non rateable element	Air filters that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Air compressors, storage cylinders and vessels (air receivers), air mains pipework.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Air
CG Code	201D72
Specific	Dryers
Descriptive	Gas 14 bar
Tech1	70m³/hr
Tech2	-
Unit size	-
Unit of measurement	Each
ERC	£1,908
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Air Dryers are situated between the air compressor and the air receiver. The Air Dryer takes the moisture out of the compressed air. This helps to prevent rust forming in the air receiver and mild steel distribution pipes. There are 3 main types, refrigerant, desiccant and desiccant drum type. Refrigerant dryers are the most common. These units can be a variety of shapes and sizes. For high pressures or where large volumes of air are continuously required the units are larger and more complex in nature. The size of the air dryer is based on the amount of air cu m / hour that is passing through the system.
Referencing details	-
Cost information notes	Costings are based on refrigerant type dryers as desiccant types are less common and slightly more costly.
rateable element	List of accessories 2. (v) coolers, purifying and other treatment apparatus, separators, filters.
non rateable element	Air filters that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Air compressors, storage cylinders and vessels (air receivers), air mains pipework.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

The size of the air dryer is based on the amount of air cu m / hour that is passing through the system.
Referencing details	-
Cost information notes	Costings are based on refrigerant type dryers as desiccant types are less common and slightly more costly.
rateable element	List of accessories 2. (v) coolers, purifying and other treatment apparatus, separators, filters.
non rateable element	Air filters that are rateable within class 1 or class 2 are rateable in their entirety.
Adjusted Plant and Machinery	Air compressors, storage cylinders and vessels (air receivers), air mains pipework.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Air Dryers are situated between the air compressor and the air receiver. The Air Dryer takes the moisture out of the compressed air. This helps to prevent rust forming in the air receiver and mild steel distribution pipes. There are 3 main types, refrigerant, desiccant and desiccant drum type. Refrigerant dryers are the most common. These units can be a variety of shapes and sizes. For high pressures or where large volumes of air are continuously required the units are larger and more complex in nature. The size of the air dryer is based on the amount of air cu m / hour that is passing through the system.

Location factor	Considered Not Applicable at time of Publication
Description	Air Filters are situated between the air compressor and the air receiver. Fine particles of oil and metal can be found after compression and the Air Filter ensures the system is free from such impurities. The air filters usually have bleeding valves at the bottom to clear the filter of impurities. The very small filters unscrew and the filter is manually changed on a regular basis. These filters have to be manually replaced over a fixed maintenance period. Larger filters are to some degree self-cleansing when flows are reversed and the offending material is collected and drained out. These systems also require regular maintenance.
Referencing details	The size of the air filter is based on the amount of air cu m / hour that is passing through the system. 1.The size / type 2.The cubic m / hour 3.The pressure of the system (bar) 4.The age
Cost information notes	In many cases there are no details in respect of the air filter just one or a series of "bottles" as part the air mains. In such cases adopt the cost 201E13
rateable element	Class 1 Table 1 (I) Air compressors. [Must be used in connection with] List of Accessories 2 (v) separators, filters, coolers, Purifying and other.

rateable element	Class 1 Table 1 (I) Air compressors. [Must be used in connection with] List of Accessories 2 (v) separators, filters, coolers, Purifying and other.
non rateable element	Must be used in conjunction with class 1 item.
Adjusted Plant and Machinery	Air compressors, storage cylinders & vessels and mains pipe work.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

ERC	£1,724
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Air Filters are situated between the air compressor and the air receiver. Fine particles of oil and metal can be found after compression and the Air Filter ensures the system is free from such impurities. The air filters usually have bleeding valves at the bottom to clear the filter of impurities. The very small filters unscrew and the filter is manually changed on a regular basis. These filters have to be manually replaced over a fixed maintenance period. Larger filters are to some degree self-cleansing when flows are reversed and the offending material is collected and drained out. These systems also require regular maintenance.
Referencing details	The size of the air filter is based on the amount of air cu m / hour that is passing through the system. 1.The size / type 2.The cubic m / hour 3.The pressure of the system (bar) 4.The age
Cost information notes	In many cases there are no details in respect of the air filter just one or a series of "bottles" as part the air mains. In such cases adopt the cost 201E13
rateable element	Class 1 Table 1 (I) Air compressors. [Must be used in connection with] List of Accessories 2 (v) separators, filters, coolers, Purifying and other.
non rateable element	Must be used in conjunction with class 1 item.

Specific	Pipes
Descriptive	Compressor to receiver
Tech1	100mm diameter
Tech2	Includes valves
Unit size	-
Unit of measurement	m
ERC	£585
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Air Pipes - Mains. Regard has to be had to the Class 1 pre- amble at (c) (iii). In the case of pneumatic power, the point where the mains supply ceases, excluding branch service piping connected with such main supply. The greater the distance from the air receiver the smaller the mains pipe becomes to avoid pressure loss i.e. it may reduce from 40 mm to 25 mm. Nevertheless this is still the main pipe. Branches are usually evident in that they are often flexible or non-steel pipes. Where systems are complex, runs are long and/or there are several off takes, non-return valves, etc. fitted.
Referencing details	The compressed air pipe colour is light blue and where pipes are galvanised (silver grey). Often a light blue bandage is put round the pipe stating what is in the pipe and the direction of flow. Where return and flow valves are installed the costs take account of this. Where details of pipe runs are poor and the pipe is of 65mm/100mm diameter with basic strap supports adopt 201C20 / 201C21 and assume length of 250m. Mains pipe can be between air compressor and air dryer / air receiver or the air receiver and the flexible branch. NOTE 1.Pipe diameter . 2.Length of main. 3.Between what? i.e. air receiver and flexible branch. 4.If valves are within pipe. 5.Age.
Cost information notes	It is likely that valves will be present in the larger mains around the air compressor and the receiver. No separate addition is required for small diameter bends but near air compressor where the pipe is 100 mm diam or greater, the cost is significant and details of the pipe dia. and number should be recorded. Where full details are not readily to hand to cost see item code 201C20 - 201C21 Where full details are known see 201C01 etc.
rateable element	List of Accessories 2(v) pipes, valves - if necessary to Class 1 or 2 rateable plant Class 1 (iii) up to and including the point where the main supply ends.
non rateable element	Class 1 (iii) any branch service piping connected with such main supply. Whole if not used in connection with Class 1 or 2 rateable plant.
Adjusted Plant and Machinery	Air compressor, air receiver, foundations, supports, pipe gantries.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Location factor	Considered Not Applicable at time of Publication
Description	Air Pipes - Mains. Regard has to be had to the Class 1 pre- amble at (c) (iii). In the case of pneumatic power, the point where the mains supply ceases, excluding branch service piping connected with such main supply. The greater the distance from the air receiver the smaller the mains pipe becomes to avoid pressure loss i.e. it may reduce from 40 mm to 25 mm. Nevertheless this is still the main pipe. Branches are usually evident in that they are often flexible or non-steel pipes. Where systems are complex, runs are long and/or there are several off takes, non-return valves, etc. fitted.
Referencing details	The compressed air pipe colour is light blue and where pipes are galvanised (silver grey). Often a light blue bandage is put round the pipe stating what is in the pipe and the direction of flow. Where return and flow valves are installed the costs take account of this. Where details of pipe runs are poor and the pipe is of 65mm/100mm diameter with basic strap supports adopt 201C20 / 201C21 and assume length of 250m. Mains pipe can be between air compressor and air dryer / air receiver or the air receiver and the flexible branch. NOTE 1.Pipe diameter . 2.Length of main. 3.Between what? i.e. air receiver and flexible branch. 4.If valves are within pipe. 5.Age.
Cost information notes	It is likely that valves will be present in the larger mains around the air compressor and the receiver. No separate addition is required for small diameter bends but near air compressor where the pipe is 100 mm diam or greater, the cost is significant and details of the pipe dia. and number should be recorded. Where full details are not readily to hand to cost see item code 201C20 - 201C21 Where full details are known see 201C01 etc.
rateable element	List of Accessories 2(v) pipes, valves - if necessary to Class 1 or 2 rateable plant Class 1 (iii) up to and including the point where the main supply ends.
non rateable element	Class 1 (iii) any branch service piping connected with such main supply. Whole if not used in connection with Class 1 or 2 rateable plant.
Adjusted Plant and Machinery	Air compressor, air receiver, foundations, supports, pipe gantries.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Compressed Air Pipes (Mains)Notes: Whereas only the mains are rateable a reduction in diameter of the pipe does not indicate the end of the mains .It is usual to regard the end of the mains where the steel pipe changes to a flexible hose see photo two. Generally main pipes are colour coded light blue but they may be galvanised (silver grey) with a directional colour band at intervals.

Generic Category	Air
CG Code	201CA5
Specific	Pipes
Descriptive	Receiver to Factory
Tech1	150mm diameter
Tech2	Excludes valves
Unit size	-
Unit of measurement	m
ERC	£110
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Air Pipes - Mains. Regard has to be had to the Class 1 pre- amble at (c) (iii). In the case of pneumatic power, the point where the mains supply ceases, excluding branch service piping connected with such main supply. The greater the distance from the air receiver the smaller the mains pipe becomes to avoid pressure loss i.e. it may reduce from 40 mm to 25 mm. Nevertheless this is still the main pipe. Branches are usually evident in that they are often flexible or non-steel pipes. Where systems are complex, runs are long and/or there are several off takes, non-return valves, etc. fitted.
Referencing details	The compressed air pipe colour is light blue and where pipes are galvanised (silver grey). Often a light blue bandage is put round the pipe stating what is in the pipe and the direction of flow. Where return and flow valves are installed the costs take account of this. Where details of pipe runs are poor and the pipe is of 65mm/100mm diameter with basic strap supports adopt 201C20 / 201C21 and assume length of 250m. Mains pipe can be between air compressor and air dryer / air receiver or the air receiver and the flexible branch. NOTE 1.Pipe diameter . 2.Length of main. 3.Between what? i.e. air receiver and flexible branch. 4.If valves are within pipe. 5.Age.
Cost information notes	It is likely that valves will be present in the larger mains around the air compressor and the receiver. No separate addition is required for small diameter bends but near air compressor where the pipe is 100 mm diam or greater, the cost is significant and details of the pipe dia. and number should be recorded. Where full details are not readily to hand to cost see item code 201C20 - 201C21 Where full details are known see 201C01 etc.
rateable element	List of Accessories 2(v) pipes, valves - if necessary to Class 1 or 2 rateable plant Class 1 (iii) up to and including the point where the main supply ends.
non rateable element	Class 1 (iii) any branch service piping connected with such main supply. Whole if not used in connection with Class 1 or 2 rateable plant.
Adjusted Plant and Machinery	Air compressor, air receiver, foundations, supports, pipe gantries.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

rateable element	Class 1 List of accessories 2(ii) storage cylinder (receiver) Class 1 List of accessories 2 (v) tank (receiver)
non rateable element	-
Adjusted Plant and Machinery	Air compressors, foundations, settings, dryers. Class 1 (list of accessories) (iii) main supply pipe, up to point where the main supply ceases.
Number of items adjusted	Assume painted finish, add 15% to cost for galvanised tanks.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	An air receiver is a storage cylinder for air at high pressure, it is made from a thick gauge of steel to withstand the pressure. It is situated after the air compressor and air dryer but before the machinery requiring compressed air. Larger sizes will require additional foundations due to their weight. A gauge showing the air pressure is usually attached and a plate will indicate the size / capacity and maximum safe working pressure in Bar.
Referencing details	Size does not matter as they are rated under list of accessories 2 (ii) or (v) Record 1. Pressure (bar) 2. Diameter 3. Height 4. Age Record if pressure gauge is attached and if concrete foundation is provided i.e. not just resting on factory floor.

It is situated after the air compressor and air dryer but before the machinery requiring compressed air. Larger sizes will require additional foundations due to their weight. A gauge showing the air pressure is usually attached and a plate will indicate the size / capacity and maximum safe working pressure in Bar.
Referencing details	Size does not matter as they are rated under list of accessories 2 (ii) or (v) Record 1. Pressure (bar) 2. Diameter 3. Height 4. Age Record if pressure gauge is attached and if concrete foundation is provided i.e. not just resting on factory floor.
Cost information notes	-
rateable element	Class 1 List of accessories 2(ii) storage cylinder (receiver) Class 1 List of accessories 2 (v) tank (receiver)
non rateable element	-
Adjusted Plant and Machinery	Air compressors, foundations, settings, dryers. Class 1 (list of accessories) (iii) main supply pipe, up to point where the main supply ceases.
Number of items adjusted	Assume painted finish, add 15% to cost for galvanised tanks.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Air conditioning
CG Code	217A15
Specific	Ducted System
Descriptive	Installed at a retail property
Tech1	From 101 up to 250 square metres floor area coverage
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£381
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Ducted system supported by an air handling unit. The system provides cooling, heating and fresh air introduction. Humidity control is not normally provided in retail premises.
Referencing details	The presence of the system will be indicated by intake and exhaust grilles in the ceiling, there will be an air handling unit situated outside or in a plantroom
Cost information notes	The cost given is per square metre of floor area benefitting from the air conditioning system.
rateable element	Class 2 Table 2 (b) together with accessories within the 'List of Accessories'
non rateable element	-
Adjusted Plant and Machinery	Electrical equipment, Boilers, Chilled water systems/pipe work, fans, Air Grilles/Diffusers.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

ERC	£81
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The costs include for excavations and disposal of surplus materials arising from the excavations being disposed on site. Pavement construction comprises imported limestone fill, lean mix concrete sub base and slip form paved pavement quality concrete and associated drainage and Above Ground Level ducting.
Referencing details	Measure area of Tarmac
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

ERC	£139
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The costs include for excavations and disposal of surplus materials arising from the excavations being disposed on site. Pavement construction comprises imported limestone fill, lean mix concrete sub base and slip form paved pavement quality concrete and associated drainage and Above Ground Level ducting.
Referencing details	Measure area of Tarmac
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Variations: The above costs should be adjusted to reflect the variations in construction and finish

Description	Single or multi-storey building containing garage and preparation areas for vehicles with associated stores, staff locker, changing and mess rooms with toilet facilities and ancillary spaces such as plant rooms. Other accommodation, such as administration offices, meeting rooms or training facilities may also be present. Commonly of framed construction with cladding to elevations surmounted by a pitched roof. Internal finishes and fixtures vary depending on accommodation usage with minimal finishes to vehicle areas and painted plaster walls, carpet tile covered floors and suspended ceilings to office or training areas. Services comprise central heating, lighting and power, sanitary and plumbing installations, data, communication and security installations, fire detection and alarm systems. In addition, air conditioning, lifts and various sustainable features, such as photovoltaic panels, may be present.
Referencing details	GEA - Gross External Area.
Cost information notes	The rate is applicable to all areas of the main building.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Berm
CG Code	208F01
Specific	Hazard containment
Descriptive	Earth bank
Tech1	Central core of brick, concrete or steel
Tech2	3m high x 1 m wide at top
Unit size	Linear Metre
Unit of measurement	m
ERC	£2,067
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	An earth bund is usually a low bank built to contain leaks or spillage from, for example, a free standing fuel tank. Earth bunds are often identical to berms but may be shallower and do not usually act as blast protection. See Bunds-33U40P. Embankment Wall, reinforced with Tensar Uniaxial Geogrid at 55Kn/m, laid horizontally to 100% vertical height of slope at 1.0 m centres, filling - excavated material spoil composted in layers
Referencing details	1. The height (vertically). 2. The width at the base. 3. What it is covered with e.g. grass, earth, boulders. 4. Length. 5. Age. 6. Width at top. 7. Slope length (base to top).
Cost information notes	This cost is based on the assumption that the bund is built on a site cleared of organic topsoil and having normal load bearing capacity. See also variations
rateable element	Class 2 Table 2(f) Protection from Hazards. Bunds, blast protection walls, berms.
non rateable element	Under Class 2 if they are not used or intended to be used mainly or exclusively in connection with services. e.g. Landscaping mounds or natural embankment
Adjusted Plant and Machinery	-
Number of items adjusted	Tanks, settings.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Surface area within bund maybe gravel or stone finished. Use code 33U1QA

Generic Category	Bitsand bases
CG Code	215J04
Specific	Raised pad of compacted fill on competent ground
Descriptive	100mm thick layer of Bitsand Base
Tech1	12m Tank Base Diameter
Tech2	-
Unit size	<12m Diameter
Unit of measurement	m2
ERC	£762
Superseded codes	None
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Tanks are normally constructed on a raised pad of free-draining granular material such as crushed stone to provide for drainage and to deter tank bottom corrosion. An asphalt or oil-sand seal is provided to the surface of the pad thus formed to prevent infiltration of water which could increase the rate of corrosion of the bottom plates. If a tank pad is not constructed out of free-draining material, then precautions to limit corrosion can be effected by providing the tank with a 100mm thick layer of oil-sand.
Referencing details	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
Cost information notes	The unit of measure is based on the tank base diameter in square metres. It has been assumed that the raised tank pad extends approx. 1m beyond the tank wall and this has been included in the rate. The cost build up includes for 100mm unreinforced concrete bed blinded with a 100mm thick layer of bitsand.
rateable element	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
non rateable element	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
Adjusted Plant and Machinery	See RM Section 5: Part 3 for general advice on identification of rateable plant and machinery forming part of the hereditament. Rateable plant and machinery is identified in accordance with the provisions of SI 2000 No. 540 in England and SI 2000 No. 1097 (W.75) in Wales.
Number of items adjusted	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. Rateable plant and machinery is identified in accordance with the provisions of SI 2000 No. 540 in England and SI 2000 No. 1097 (W.75) in Wales.
Number of items adjusted	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Bitsand bases
CG Code	215J13
Specific	Raised pad of compacted fill on competent ground
Descriptive	100mm thick layer of Bitsand Base
Tech1	40-50m Tank Base Diameter
Tech2	-
Unit size	40-50m Diameter
Unit of measurement	m2
ERC	£2,460
Superseded codes	None
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Tanks are normally constructed on a raised pad of free-draining granular material such as crushed stone to provide for drainage and to deter tank bottom corrosion. An asphalt or oil-sand seal is provided to the surface of the pad thus formed to prevent infiltration of water which could increase the rate of corrosion of the bottom plates. If a tank pad is not constructed out of free-draining material, then precautions to limit corrosion can be effected by providing the tank with a 100mm thick layer of oil-sand.
Referencing details	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
Cost information notes	The unit of measure is based on the tank base diameter in square metres. It has been assumed that the raised tank pad extends approx. 1m beyond the tank wall and this has been included in the rate. The cost build up includes for 100mm unreinforced concrete bed blinded with a 100mm thick layer of bitsand.
rateable element	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
non rateable element	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
Adjusted Plant and Machinery	See RM Section 5: Part 3 for general advice on identification of rateable plant and machinery forming part of the hereditament. Rateable plant and machinery is identified in accordance with the provisions of SI 2000 No. 540 in England and SI 2000 No. 1097 (W.75) in Wales.
Number of items adjusted	Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Generic Category	Boilers
CG Code	202A07
Specific	High pressure - water tube
Descriptive	Class 1 Table 1 - including List of Accessories
Tech1	Evp lb/hr x 1000 100
Tech2	600 Psig
Unit size	Each Plant/system
Unit of measurement	Each
ERC	£4,197,210
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour. A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins. Calculate values on the working rate only but have a note of the maximum rate especially if it is substantially greater that the present operating rate. lb/sq inch This is the working pressure of the boiler and under 250lb/sq in is regarded as low pressure and over 300lb/sq in as high pressure. Low Pressure -Heating and process steam High Pressure-Driving (power) and process steam 1 Bar = 14.5 psig (at atmosphere) psig General:Hot water boiler-Rated in btu/hour Steam boilers-Rated in evaporated lbs/hour
Referencing details	Dimensions and working pressure/temperatures
Cost information notes	-
rateable element	Boiler (Class 1 Table 1 including list of accessories)
non rateable element	(i) Process Boiler unless rateable under Class 4 Table 4 and passes "structure" tests
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	NB: add 15-20% for economiser and super heaters

Description	Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour. A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins. Calculate values on the working rate only but have a note of the maximum rate especially if it is substantially greater that the present operating rate. lb/sq inch This is the working pressure of the boiler and under 250lb/sq in is regarded as low pressure and over 300lb/sq in as high pressure. Low Pressure -Heating and process steam High Pressure-Driving (power) and process steam 1 Bar = 14.5 psig (at atmosphere) psig General:Hot water boiler-Rated in btu/hour Steam boilers-Rated in evaporated lbs/hour
Referencing details	Dimensions and working pressure/temperatures
Cost information notes	-
rateable element	Boiler (Class 1 Table 1 including list of accessories)
non rateable element	(i) Process Boiler unless rateable under Class 4 Table 4 and passes "structure" tests
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	NB: add 15-20% for economiser and super heaters

Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Costs stated are for the Rateable Class 4 Table 4 element only

Description	Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour
Referencing details	"This particular item will normally be encountered in service as a 'process' boiler, providing heat in the form of steam for manufacturing processes. But it is possible that it may have multiple functions: If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for 'power'. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service 'to' the hereditament. If it is mainly used as a 'process' boiler, it could be rateable within Class 4, but only if it passes the Class 4 'structure' tests."
Cost information notes	-

Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour
Referencing details	"This particular item will normally be encountered in service as a 'process' boiler, providing heat in the form of steam for manufacturing processes. But it is possible that it may have multiple functions: If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for 'power'. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service 'to' the hereditament. If it is mainly used as a 'process' boiler, it could be rateable within Class 4, but only if it passes the Class 4 'structure' tests."
Cost information notes	-
rateable element	Boiler (Class 4 Table 4) structural part of Boiler only
non rateable element	Process Boiler unless rateable under Class 4 Table 4
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Costs stated are for the Rateable Class 4 Table 4 element only

Description	Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour

Description	Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour
Referencing details	"This particular item will normally be encountered in service as a 'process' boiler, providing heat in the form of steam for manufacturing processes. But it is possible that it may have multiple functions: If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for 'power'. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service 'to' the hereditament. If it is mainly used as a 'process' boiler, it could be rateable within Class 4, but only if it passes the Class 4 'structure' tests."
Cost information notes	-
rateable element	Boiler (Class 4 Table 4) structural part of Boiler only
non rateable element	Process Boiler unless rateable under Class 4 Table 4
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Costs stated are for the Rateable Class 4 Table 4 element only

Generic Category	Boilers
CG Code	202A71
Specific	High pressure - water tube
Descriptive	Class 4 Table 4 element only
Tech1	Evp 600,000 lb/hr
Tech2	1200 Psig
Unit size	Each Plant/system
Unit of measurement	Each
ERC	£12,847,805
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour
Referencing details	"This particular item will normally be encountered in service as a 'process' boiler, providing heat in the form of steam for manufacturing processes. But it is possible that it may have multiple functions: If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for 'power'. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service 'to' the hereditament. If it is mainly used as a 'process' boiler, it could be rateable within Class 4, but only if it passes the Class 4 'structure' tests."
Cost information notes	-
rateable element	Boiler (Class 4 Table 4) structural part of Boiler only
non rateable element	Process Boiler unless rateable under Class 4 Table 4 Table 1 or Class 2 Table purposes unless rateable under Class 4 Table 4. Accessories
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Description	Variety of boilers similar in shape and design to domestic gas hot water boilers, used to raise hot water (but sometimes steam). Single heater by-pass system used for heating Factories, Sports Centres, Universities, Colleges etc. Maximum work pressure not greater than 7 bars. Main source of heat is gas, gas oil or oil. Steam or Hot water is used for heating or process or a combination of both. For greater output units may be linked together but for larger amounts of constant heat a small package boiler is more suitable. Heat recovery from the exhaust gases utilised for ducted warm air or further warm water. Boilers are constructed of mild steel and include safety valves, water gauges and computer controls. Can work in groups of 4, 5, and 6 up to a range of 16 in order to give the required kW output. Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins.
Referencing details	Boilers will be rateable where Steam is used for Power (Class 1 Table 1) Services i.e. Heat (Class 2 Table 2) or it is a Named Structure (when used for the Process)(Class 4 Table 4) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Most modern boilers are rated in kW / hr.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Boilers
CG Code	202C04
Specific	Industrial Space heating-hot water
Descriptive	Sets of 24 kw Boilers
Tech1	Ht 1200mm - depth 1300mm - linked width various (These are only generic dimensions).
Tech2	Output 384 kW
Unit size	Each (system to give total kW output)
Unit of measurement	Each
ERC	£31,523
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Variety of boilers similar in shape and design to domestic gas hot water boilers, used to raise hot water (but sometimes steam). Single heater by-pass system used for heating Factories, Sports Centres, Universities, Colleges etc. Maximum work pressure not greater than 7 bars. Main source of heat is gas, gas oil or oil. Steam or Hot water is used for heating or process or a combination of both. For greater output units may be linked together but for larger amounts of constant heat a small package boiler is more suitable. Heat recovery from the exhaust gases utilised for ducted warm air or further warm water. Boilers are constructed of mild steel and include safety valves, water gauges and computer controls. Can work in groups of 4, 5, and 6 up to a range of 16 in order to give the required kW output. Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins.
Referencing details	Boilers will be rateable where Steam is used for Power (Class 1 Table 1) Services i.e. Heat (Class 2 Table 2) or it is a Named Structure (when used for the Process)(Class 4 Table 4) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Most modern boilers are rated in kW / hr.
Cost information notes	-
rateable element	Boiler (Class 1 Table 1 including list of accessories)
non rateable element	i) Process Boiler unless rateable under Class 4 Table 4 ii)Dual-purpose boiler not used ¬mainly or exclusively¬ for either Class 1 Table 1 purpose
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. For greater output units may be linked together but for larger amounts of constant heat a small package boiler is more suitable. Heat recovery from the exhaust gases utilised for ducted warm air or further warm water. Boilers are constructed of mild steel and include safety valves, water gauges and computer controls. Can work in groups of 4, 5, and 6 up to a range of 16 in order to give the required kW output. Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins.
Referencing details	Boilers will be rateable where Steam is used for Power (Class 1 Table 1) Services i.e. Heat (Class 2 Table 2) or it is a Named Structure (when used for the Process)(Class 4 Table 4) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Most modern boilers are rated in kW / hr.
Cost information notes	-
rateable element	Boiler (Class 1 Table 1 including list of accessories)
non rateable element	i) Process Boiler unless rateable under Class 4 Table 4 ii)Dual-purpose boiler not used ¬mainly or exclusively¬ for either Class 1 Table 1 purpose
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Variety of boilers similar in shape and design to domestic gas hot water boilers, used to raise hot water (but sometimes steam). Single heater by-pass system used for heating Factories, Sports Centres, Universities, Colleges etc. Maximum work pressure not greater than 7 bars. Main source of heat is gas, gas oil or oil. Steam or Hot water is used for heating or process or a combination of both. For greater output units may be linked together but for larger amounts of constant heat a small package boiler is more suitable. Heat recovery from the exhaust gases utilised for ducted warm air or further warm water. Boilers are constructed of mild steel and include safety valves, water gauges and computer controls. Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Boilers
CG Code	202C49
Specific	Industrial Space heating-hot water
Descriptive	Single Gas fired boilers
Tech1	Height 1500mm-width1150mm-depth4530mm (These are only generic dimensions).
Tech2	Output 366 kW
Unit size	Each (system to give total kW output)
Unit of measurement	Each
ERC	£16,867
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Variety of boilers similar in shape and design to domestic gas hot water boilers, used to raise hot water (but sometimes steam). Single heater by-pass system used for heating Factories, Sports Centres, Universities, Colleges etc. Maximum work pressure not greater than 7 bars. Main source of heat is gas, gas oil or oil. Steam or Hot water is used for heating or process or a combination of both. For greater output units may be linked together but for larger amounts of constant heat a small package boiler is more suitable. Heat recovery from the exhaust gases utilised for ducted warm air or further warm water. Boilers are constructed of mild steel and include safety valves, water gauges and computer controls. Can work in groups of 4, 5, and 6 up to a range of 16 in order to give the required kW output. Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins.
Referencing details	output in kW
Cost information notes	-
rateable element	Boiler (Class 1 Table 1 or Class 2 Table 2 including list of accessories)
non rateable element	i) Process Boiler unless rateable under Class 4 Table ii) Dual-purpose boiler not used ¬mainly or exclusively¬ for either Class iii) 1 Table 1 purposes unless rateable under Class 4 Table 4. Accessories to Class 4 boilers. Certain conditions under Class 2
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Shell Boilers: - Shell boilers are filled with water (top) and have a combustion chamber (lower). The heat passes through the water and makes it hot. In some cases the heat turns the water to steam. General information: - These boilers are used for hot water purposes and low-pressure steam and are also used for heating the property, providing hot water for kitchens, showers and toilets et cetera. [In rental valuations the cost of the heating boiler will be reflected in the rate adopted for the floor area, which will include an element for heating. In such circumstances DO NOT add separately for the heating boiler]. Hot water from these boilers may be used in the process of the occupier, e.g. cooking vegetables in a canning factory. Steam can be used for heating purposes and as part of the process. Boilers are made from mild steel and are circular however some are contained within a square acoustic / insulated "box". Usually gas fired these boilers can be gas oil fired and in very unusual circumstances coke or alternative fuels can be employed. Costs include instrumentation. Costs do not include concrete foundations of settings. Water Tube: Tubes containing water pass through a main firebox and the water heats up. Usually these boilers are for steam production the steam being used for heating purposes on the hereditament and in the process being undertaken on the premises. The smaller tube steam boilers are unlikely to be used for power generation.

Referencing details	Class 1 Table 1 Plant and Machinery specified in Table 1 below which is USED or INTENDED to be USED MAINLY OR EXCLUSIVELY in connection with\¬85 "Mainly" This does not mean the % must be more than 50% i.e.:Power (Class 1) 45%Heating (Class 2) 35%Process (Class 4) 20% Mainly Class 1 All the boiler is RateableOr Power (Class 1) 20%Heating (Class 2) 55%Process (Class 4) 25%Class 2 (in part) All the boiler is RateableOr Power (Class 1) 30%Heating (Class 2) 30%Process (Class 4) 40%Class 4 Not Rateable Class 1 or 2 (If any part is in Class 2 the whole is rateable under this class) But may be rateable under Class 4"Mainly" Do not add together the % for Class 1 and Class 2 in order to be greater than Class 4The words mainly have been omitted from Class 2 (SI 2000 540) and thus any boiler, which is in part rateable under Class 2, is a Class 2 boiler. (Some discretion may be required if only a small part of the boilers output is used for Class 2 purposes. If the boiler is not mainly Class 1 or in any part Class 2 THE WHOLE BOILER IS RATEABLE If the boiler is not mainly Class 1 or rateable under Class 2Look at Class 4Class 4 Table 4 Boilers Note Class 4(b) Applies to accessories Class 4 (c) Applies to whole bolier (a) Only the structural elements are rateable therefore no "Twiddly Bits" values, pipes, gauges etc (b) 400m3 - readily capable of being moved from one site and re-erected in its original state on another without the substantial demolition of any surrounding structure. Boilers will be rateable where Steam is used for Power (Class 1 Table 1) Services i.e. Heat (Class 2 Table 2) or it is a Named Structure (when used for the Process)(Class 4 Table 4)

(Some discretion may be required if only a small part of the boilers output is used for Class 2 purposes. If the boiler is not mainly Class 1 or in any part Class 2 THE WHOLE BOILER IS RATEABLE If the boiler is not mainly Class 1 or rateable under Class 2Look at Class 4Class 4 Table 4 Boilers Note Class 4(b) Applies to accessories Class 4 (c) Applies to whole bolier (a) Only the structural elements are rateable therefore no "Twiddly Bits" values, pipes, gauges etc (b) 400m3 - readily capable of being moved from one site and re-erected in its original state on another without the substantial demolition of any surrounding structure. Boilers will be rateable where Steam is used for Power (Class 1 Table 1) Services i.e. Heat (Class 2 Table 2) or it is a Named Structure (when used for the Process)(Class 4 Table 4)
Cost information notes	-
rateable element	Boiler (Class 1 Table 1 or Class 2 Table 2 including list of accessories)
non rateable element	-
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Shell Boilers: - Shell boilers are filled with water (top) and have a combustion chamber (lower). The heat passes through the water and makes it hot. In some cases the heat turns the water to steam. General information: - These boilers are used for hot water purposes and low-pressure steam and are also used for heating the property, providing hot water for kitchens, showers and toilets et cetera. [In rental valuations the cost of the heating boiler will be reflected in the rate adopted for the floor area, which will include an element for heating. In such circumstances DO NOT add separately for the heating boiler]. Hot water from these boilers may be used in the process of the occupier, e.g. cooking vegetables in a canning factory. Steam can be used for heating purposes and as part of the process. Boilers are made from mild steel and are circular however some are contained within a square acoustic / insulated "box". Usually gas fired these boilers can be gas oil fired and in very unusual circumstances coke or alternative fuels can be employed. Costs include instrumentation. Costs do not include concrete foundations of settings. Water Tube: Tubes containing water pass through a main firebox and the water heats up. Usually these boilers are for steam production the steam being used for heating purposes on the hereditament and in the process being undertaken on the premises. The smaller tube steam boilers are unlikely to be used for power generation.

Referencing details	“This particular item will normally be encountered in service as a ‘process’ boiler, providing heat in the form of steam for manufacturing processes. But it is possible that it may have multiple functions: If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for ‘power’. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service ‘to’ the hereditament. If it is mainly used as a ‘process’ boiler, it could be rateable within Class 4, but only if it passes the Class 4 ‘structure’ tests.”

(Some discretion may be required if only a small part of the boilers output is used for Class 2 purposes. If the boiler is not mainly Class 1 or in any part Class 2 THE WHOLE BOILER IS RATEABLE If the boiler is not mainly Class 1 or rateable under Class 2Look at Class 4Class 4 Table 4 Boilers Note Class 4(b) Applies to accessories Class 4 (c) Applies to whole bolier (a) Only the structural elements are rateable therefore no "Twiddly Bits" values, pipes, gauges etc (b) 400m3 - readily capable of being moved from one site and re-erected in its original state on another without the substantial demolition of any surrounding structure. Boilers will be rateable where Steam is used for Power (Class 1 Table 1) Services i.e. Heat (Class 2 Table 2) or it is a Named Structure (when used for the Process)(Class 4 Table 4)
Cost information notes	-
rateable element	Boiler (Class 1 Table 1 or Class 2 Table 2 including list of accessories)
non rateable element	-
Adjusted Plant and Machinery	Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	The rate detailed above is based on drilling the borehole to 100m depth. The rate is an all in rate and does not include for mobilisation , transportation of the drilling rig, set up drilling, (See Code 203A02A). or for any pumping equipment.
Referencing details	Record the diameter of bore hole and depth in metres
Cost information notes	The costs are based on medium hard subsoil. Any extreme condition will increase the cost.
rateable element	Class 4, Table 3. Well casings and liners. Note: value of land may in addition be increased due to having potable water available. The well casing is EXTRA
non rateable element	Unlined hole (i.e. not plant and machinery but note that value of the land may be enhanced by the presence of the hole).
Adjusted Plant and Machinery	Pumps, generators, tanks and reservoirs
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If boreholes are in made ground/landfill or hard rock e.g. granite or sandstone then the above costs should be increased by 50%.

Referencing details	-
Cost information notes	The cost of drilling and lining a borehole is per metre depending on geology. The single most important factor determining the cost of the borehole itself is therefore, how deep does it have to be? (It is strongly recommend a geological survey is undertaken to take the guesswork out of this.)

Generic Category	Boreholes
CG Code	203A10
Specific	Water
Descriptive	Plastic pipe
Tech1	150mm (6")
Tech2	-
Unit size	m
Unit of measurement	m
ERC	£311
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Plastic tube used for lining - typically 150 mm diameter. The rate detailed above is based on drilling the borehole to 100m depth. The rate is an all in rate and does not include for mobilisation , transportation of the drilling rig, set up drilling, (See Code 203A10A). or for any pumping equipment.
Referencing details	Depth of lining. Dia Metre
Cost information notes	Add for setting up boring rig
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Boreholes
CG Code	203A01
Specific	Water
Descriptive	Steel pipe
Tech1	150mm (6")
Tech2	-
Unit size	Linear Metre
Unit of measurement	m
ERC	£201
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The rate detailed above is based on drilling the borehole to 100m depth. The rate is an all in rate and does not include for mobilisation , transportation of the drilling rig, set up drilling, (See Code 203A01A). or for any pumping equipment.
Referencing details	Record the diameter of bore hole and depth in metres
Cost information notes	The costs are based on medium hard subsoil. Any extreme condition will increase the cost.
rateable element	Class 4, Table 3. Well casings and liners. Note: value of land may in addition be increased due to having potable water available. The well casing is EXTRA
non rateable element	Unlined hole (i.e. not plant and machinery but note that value of the land may be enhanced by the presence of the hole).
Adjusted Plant and Machinery	Pumps, generators, tanks and reservoirs
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If boreholes are in made ground/landfill or hard rock e.g. granite or sandstone then the above costs should be increased by 50%.

Tech2	Ten Lane
Unit size	10 Lane
Unit of measurement	m2
ERC	£0
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Modern purpose built ten-pin bowling alley located in an out-of-town leisure park with complementary leisure uses; usually housed in steel portal frame structures with profiled metal sheet cladding. Generally provided with ten lanes for ten-pin bowling with screens and oiled timber floors, reception counter, shoe storage, spectator seating, air hockey tables, arcade games, dining seating, bar and kitchen.
Referencing details	Measure To GEA - Refer to Rating Manual Section 5a Valuation of all property types -:Bowling Alleys
Cost information notes	The recommended valuation approach is to adopt an overall price per square metre GEA which reflects the location and physical characteristics of the property. In such cases, rents, on a shell basis, should be analysed to a price/m2 GEA. Details of fit-out costs will also be required for analysis to provide an appropriate addition to reflect fit-out.

ERC	£250
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Concrete building, typically 7m x 6.6m x 16.75m high containing a 5.3m x 5.3 m x 10m high hopper of 281 m^3 capacity equivalent to 325 tonnes of coal
Referencing details	Cubic volume of whole building measured internally.
Cost information notes	Costs include building and hopper but exclude external works, conveyors and housings and housing supports
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	Conveyors, housings, trestles, walkways
Number of items adjusted	The plant and machinery listed in the description has been included in this costing.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	-
Photo description	Single concrete hopper
Photo notes	A reinforced concrete building containing a concrete hopper bottomed bunker silo supported on concrete columns and used for storing coke, coal, iron ore.

Description	A square or rectangular hopper bottomed structure of sheet steel plate of varying thickness, including support steelwork Holding Volume 100m3 Plate Thickness 6 mm to 12mm
Referencing details	Holding volume of hopper and external works
Cost information notes	Based on holding volume of hopper. Use cost for total volume of all hoppers in one structure. Costs include supporting steelwork but exclude foundations. The plant and machinery listed in the description has been included in this costing.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	Conveyors, settings, housings and external works
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Add foundation costs - see either isolated bases or floor slab cost

Referencing details	Holding volume of hopper and external works
Cost information notes	Based on holding volume of hopper. Use cost for total volume of all hoppers in one structure. Costs include supporting steelwork but exclude foundations. The plant and machinery listed in the description has been included in this costing.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	Conveyors, settings, housings and external works
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Add foundation costs - see either isolated bases or floor slab cost

Generic Category	Canopies
CG Code	30C010
Specific	Cantilever
Descriptive	Industrial
Tech1	<= 5m span
Tech2	Simple
Unit size	-
Unit of measurement	m2
ERC	£196
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Canopies are extensions or attachments to an existing building for the purpose of providing shelter whilst loads are unloaded. This cost relates to a canopy cantilevered from one side of the building with no additional support columns. Usually the canopy will contain a profiled metal deck system with associated rainwater goods. Due to the lack of additional supporting columns side panels are not fitted.
Referencing details	Measured as GEA
Cost information notes	Cost based on a 5m wide structure cantilevered with a 0.7mm aluminium roofing, commercial grade. Uninsulated fabric. Lighting not included. When determining the costs to apply to canopies one should consider the individual property overall and appraise whether or not any form of quantum is appropriate.

Description	A stand-alone car wash. They are usually positioned on a flat level site with good access from a busy main road. The site area is normally one-third to half an acre with good bitumen macadam surfacing and car parking for 5 or 6 cars. The car wash equipment is housed in a steel framed building around 120m2 in area with a profiled metal flat roof or pitched roof covered with artificial slate or tile. Under the floor of the building there are concrete re-circulation chambers where grit is allowed to settle out of used water. The walls to the building are usually tiled internally with ceramic tiles. Eaves height is around 3.6m

Generic Category	Chimneys
CG Code	32F15S1
Specific	Accessory
Descriptive	Single LED Aircraft Warning Lights
Tech1	>45 metres Above Ground Level
Tech2	Medium Intensity Steady Red Safety Light
Unit size	Each
Unit of measurement	Each
ERC	£53,305
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	To ensure aviation safety and in accordance with relevant Air Navigation Orders the person in charge of an en-route obstacle must ensure that it is fitted with medium intensity steady red lights positioned as close as possible to the top of the obstacle and at intermediate levels spaced so far as practicable equally between the top lights and ground level with an interval of not more than 52 metres. Low intensity lights are required for structures below 45 metres in height, medium/high intensity lights (location dependent) are required for structures above 45 metres in height. Cost can differ significantly due to site influences and location.
Referencing details	Identify presence and number of aviation warning lights.
Cost information notes	Cost is for the complete installation of Aviation Warning Lights based on a structure exceeding 45 metres in height.
rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
non rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery

Description	Brick built flue stacks are no longer constructed but may still be present and active on some industrial sites. Usually constructed from class B engineering brickwork built circular on plan with 50mm fireclay lining to internal face bonded to the chimney stack.
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Description	Single flue reinforced concrete stack usually lined with a 110mm refractory or engineering brick lining. Predominantly used for boilers/plant burning fossil fuels and fuels with a high sulphur content. Single flue reinforced concrete stacks began to replace the traditional solid brick stack from approximately the 1940s.
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Description	Reinforced concrete windshields usually used with multi-flue stacks constructed from either sectional brickwork or metallic flues. Generally the air space around the flues is ventilated. Commonly known as "Multi-Flue Reinforced Concrete Stacks".
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.
rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
non rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
Adjusted Plant and Machinery	Flues and Ducts
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

(Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category For Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Description	Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Generic Category	Chimneys
CG Code	32F20T
Specific	Flue Liner
Descriptive	Steel
Tech1	12mm plate
Tech2	Flue Diameter - 3.25m
Unit size	m height
Unit of measurement	m
ERC	£7,165
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.
rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
non rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
Adjusted Plant and Machinery	Flues and Ducts
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	NOTE: Unlined chimney stack approximately 33% less.

Generic Category	Chimneys
CG Code	32F43C
Specific	Multiple Chimney Stacks
Descriptive	Steel Self-supporting lined - 1.5m diameter at base
Tech1	25m high including foundations
Tech2	4 no
Unit size	25m
Unit of measurement	Each
ERC	£475,506
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Self-supporting steel flue stacks. Circular in cross-section, tall and slender tapering towards the top of the stack. Usually lined to provide heat insulation protection to the steel structure, level of insulation dependent upon the temperatures of the flue. See Variations for unlined stacks.
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.
rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
non rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
Adjusted Plant and Machinery	Flues and Ducts

Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	NOTE: Unlined chimney stack approximately 33% less.

Generic Category	Chimneys
CG Code	32F50A
Specific	Multiple Chimney Stacks
Descriptive	Steel Self-supporting lined - 2m diameter at base
Tech1	10m high including foundations
Tech2	4 no
Unit size	10m
Unit of measurement	Each
ERC	£285,088
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Self-supporting steel flue stacks. Circular in cross-section, tall and slender tapering towards the top of the stack. Usually lined to provide heat insulation protection to the steel structure, level of insulation dependent upon the temperatures of the flue. See Variations for unlined stacks.
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per complete multiple flue stack installation above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.
rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
non rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
Adjusted Plant and Machinery	Flues and Ducts
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. Generic Category	Chimneys
CG Code	32F56A
Specific	Multiple Chimney Stacks
Descriptive	Steel Self-supporting lined - 2m diameter at base
Tech1	40m high including foundations
Tech2	4 no
Unit size	40m
Unit of measurement	Each
ERC	£853,114
Superseded codes	32F64A
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Self-supporting steel flue stacks. Circular in cross-section, tall and slender tapering towards the top of the stack. Usually lined to provide heat insulation protection to the steel structure, level of insulation dependent upon the temperatures of the flue. See Variations for unlined stacks.
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per complete multiple flue stack installation above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.
rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
non rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
Adjusted Plant and Machinery	Flues and Ducts
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. Cost information notes	Cost is per metre above ground level up to a maximum height of 100m. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.
rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
non rateable element	Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery
Adjusted Plant and Machinery	Flues and Ducts
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Chimneys
CG Code	32F14F
Specific	Steel
Descriptive	Unlined self-supporting flue stack
Tech1	1250mm diameter at base
Tech2	Height Up to 100m
Unit size	<100m
Unit of measurement	m
ERC	£1,799
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Single steel self-supporting flue stack lined internally. Thickness of steel plate assumed to be 12.00mm for flue stacks up to to 100m above ground level. Circular in cross-section usually tapering towards the top of the stack. Lined to provide heat and corrosion protection to the steel structure. Presence of lining dependent upon the temperatures of the flue and chemical composition of the flue gases.
Referencing details	Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.
Cost information notes	Cost is per metre above ground level up to a maximum height of 100m. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£1,753
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Typically a two storey building with boat storage facility on the ground floor and clubhouse, changing facilities, toilets etc to first floor. Sample building has a steel frame with external walls of cladding & curtaining walling, precast concrete first floor and stairs and a mixture of blockwork and stud partitions. Internal finishes comprise emulsion to plastered walls and plasterboard ceilings with vinyl floor coverings on screed. There are painted timber doors & painted MDF skirting, cubicles & Integrated Plumbing System (IPS) panels and possibly a motorised roller shutter to the kitchen. The services comprise sanitary, plumbing, mechanical & electrical installations with some sustainable features. Cost is for a typical "shed" type construction which is used by a club as opposed to a building developed as a commercial enterprise with public access.
Referencing details	GEA - Gross External Area.

Description	Generally a two storey building housing changing rooms with showers and toilets, extensive social/activity/multipurpose/function space, additional toilet facilities, catering kitchen, bar and ancillary storage and office space. Additional facilities may include sports hall, gym, treatment rooms, meeting rooms or retail space for club merchandise. The building is designed to host external functions in addition to the day-to-day sport related uses and has the facilities to provide hot meals. Great variations in design, external finishes and construction between buildings. Steel frame with external walls finished with a range of cladding materials is common. Internally the finishes are of good quality particularly to areas available for hire and commonly comprise emulsion or ceramic tiling/uPVC sheeting to plastered walls, combination of painted plasterboard and suspended ceilings and combination of vinyl, carpet and ceramic tiling floor coverings on screed with specialist timber sports floor to sports hall if present. Cubicles, lockers and benches together with kitchen and bar fittings and display cabinets. Services provision generally comprises heating, extensive sanitary, plumbing and ventilation installations to changing and toilet areas, power, lighting, lift, fire and intruder alarms, data and audio visual (AV) installations with possible air conditioning/cooling, additional security installations and sustainable features.

Description	Generally a single storey building housing changing rooms with showers and toilets, social/activity/multipurpose space, public toilet facilities and often basic kitchen, bar or café facilities and possibly a store or a small staff office. Commonly located in public parks, adjacent to public or school sport pitches or at sport clubs. Great variations in design, external finishes and construction between buildings. Steel frame with masonry external walls finished with a range of materials is common. Internally finishes can be very limited to some buildings depending on quality but commonly comprise emulsion or ceramic tiling/uPVC sheeting to plastered walls, combination of painted plasterboard and suspended ceilings and vinyl floor coverings on screed. Cubicles, lockers and benches together with kitchen/bar fittings (if present). Services provision varies particularly when it comes to heating installations (although boiler as a heat source and Low Temperature Hot Water (LTHW) radiators or underfloor heating are common) and in addition to heating generally comprises extensive sanitary, plumbing and ventilation installations to changing and toilet areas, power, lighting, fire and intruder alarms with possible additional security and data installations and sustainable features.

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Adaptation costs only, internally to a standard industrial building to provide a Cold Store (not a freezer). These costs should be added to those for the industrial building. Costs include for extra depth excavation to accommodate the necessary floor recess to accept the insulated floor including heat mat; secondary support steelwork for walls and ceiling; Proprietary 150mm floor, wall and ceiling panels; personnel/fire escape doors and rapid roll forklift access doors; nominal provision of mechanical installation [NOTE: Chiller Plant and electrical installation is excluded)
Referencing details	Measure external dimensions- deduct wall thickness to provide GEA dimension and record internal height.
Cost information notes	External works are excluded
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	Chiller plant, motors and compressors
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Concrete block works
CG Code	40CB01
Specific	Concrete block drying chambers
Descriptive	Concrete block curing/drying chamber used solely as a curing chamber or drying kiln for the production of concrete blocks. Usually constructed in situ within an industrial portal framed shed; traditionally constructed using either concrete or brick masonry walls to create the curing/drying chamber.
Tech1	upto 2.5m high
Tech2	<3500m3
Unit size	3500m3
Unit of measurement	m3
ERC	£468
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	The production of concrete blocks in the UK is usually carried out in modern automated plants. Moulds are filled with concrete and vibro-compacted on pallets. De-moulded blocks are transported onto a pallet by conveyor to the curing/drying chambers. Additional heating may be provided to promote a speedy increase in strength using either heated air or steam. When curing has been completed the blocks are removed from the chamber and stacked for delivery. Curing/drying chambers are a basic structure constructed insitu within an industrial shed; built off the existing concrete ground floor slab with concrete block/brick walls, approx. 2.5m (internal) height. Usually open on two sides with the open ends being enclosed with heavy-duty industrial plastic curtains facilitating access for a fork lift truck or track inset for trolleys stacked with blocks to be pushed in and out through the curtained ends. Curing/drying chambers are similar to Low Temperature Tunnel Dryers found in brickmaking plant (see also codes Furnaces Kilns - Brick 209K01 and Furnaces Dryer Brick 209K02) but should not be confused with specialist bespoke manufactured plant such as Keller and Lingl type chamber dryers.
Referencing details	Measure gross external volume Refer to Rating Manual Section 5a: Valuation of all property classes: Brickworks and clay tileworks
Cost information notes	Cost includes rail track set in the floor of the curing/drying chamber. Unit of measure is cubic metres (m3).
rateable element	Concrete block curing/drying chambers are rateable if they pass the building or structure tests in accordance with Class 4
non rateable element	Measure gross external volume. Refer to Rating Manual Section 5a: Valuation of all property classes: Brickworks and clay tileworks
Adjusted Plant and Machinery	Ancillary ducting, lighting, alarms, plant and machinery providing heated air or steam.
Number of items adjusted	Identify on site - However may include other Class 4 items of plant such as:- Rail tracks and transfer ways for kiln cars Weighbridge pits

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	For block drying chambers >3500m3 use code 40CBV1

Description	Building Construction: - Foundations: None. Upper Floors: None. Roof: Flat timber roof no waterproof covering. External Walls: Single skin insulated timber frame with cement fibre profile cladding and plasterboard inner face. Windows and Doors: Double glazed uPVC. Internal Walls: Metal stud partitions. Internal Finishes: Emulsion paint to plastered walls and ceilings, vinyl sheet flooring. Building Services: Basic lighting and heating. Heating from main building. This structure is within an existing building. Variations may include brick walls, timber windows, raised access floors and built between storey heights.
Referencing details	Measure to GEA
Cost information notes	Exclude: External works and services All loose fixture and fittings. A reduction of 5% is to be made where the shorter side of a building with a ratio of 1:1.5 is adjoining another property.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Conveyors
CG Code	205E30
Specific	Cover Plate
Descriptive	Steel
Tech1	2mm
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£81
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The cover plate sits structurally between the supporting structure and the conveyor rollers and belting. Plate will be nominally 2mm thick across width of structure. The specification of light and heavy steel support frame pieces is similar however the light frame is of smaller cross section, lower height with smaller angle legs and thus unable to support the heavier loads imparted. Increased steel work size for heavy frames The cover plate is assumed to be 2mm thick and of carbon/mild steel. This is added over the steel conveyor support under the belt to prevent produce from dropping under the belt. In some cases there may be additional cladding to the sides or roof and this is an additional cost. All steelwork is taken as being galvanised.
Referencing details	Width of conveyor and length in m. Area of plate = m2 Any additional cladding to sides or roof should be noted and added.
Cost information notes	For walkways over and at side of conveyor, carried from same framework see Stairways, Ladders and Walkways. For mesh flooring see Floors, GRP or Weld mesh. For cladding see External Walls cladding
rateable element	Unless the conveyor is being rated under Class 1 List of Accessories 1 the belt, drive motor and idler sets are not rateable and thus the steel supports
non rateable element	Belt, motor and idlers (unless rated under List of Accessories 1).
Adjusted Plant and Machinery	Platforms, stairways
Number of items adjusted	It is assumed that the item forms part of an "average size industrial, commercial or office complex". Where it would be normal to find more than one item in such a hereditament the ERC stated has been adjusted to reflect any number / quantity, discount. These figures are NOT one off figures.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	A Conveyor Junction House is found at changes in direction and level of the conveyor system. General construction is typically a cladded steel framed structure sitting on a support steel framework (additional cost). The steel work of the cladded junction house includes universal columns 203mm X 203mm X 46kg/m with horizontal frame bracing of universal beams 203mm x 133mm x 25kg/m. The latter usually provides the rafters for any housing roof. The main structure is usually cross braced with 150mm x 150mm x 15kg/m angle section members. The junction house is usually clad in either painted, galvanised or plasticoated single skin profiled steel sheeting affixed to rails or purlins. The roof is similarly clad with ridge, flashing and eaves trims. Height of housing structure is typically 4m with a single floor. Floor construction is commonly chequer plate floor on treated timber joists fixed between steel frame members. Stairs or access ladders need to be added as applicable.
Referencing details	Total VOLUME of the cladded junction house covered by roof. Excludes supports , structures and foundations
Cost information notes	Excludes support frame and foundations. Stairs or access ladders need to be added as applicable. Lightning protection to be added as applicable. For additional cost of extra walkways see 215N11 or similar.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	A Conveyor Junction House is found at changes in direction and level of the conveyor system. General construction is typically a cladded steel framed structure sitting on a support steel framework (additional cost). The steel work of the cladded junction house includes universal columns 203mm X 203mm X 46kg/m with horizontal frame bracing of universal beams 203mm x 133mm x 25kg/m. The latter usually provides the rafters for any housing roof. The main structure is usually cross braced with 150mm x 150mm x 15kg/m angle section members. The junction house is usually clad in either painted, galvanised or plasticoated single skin profiled steel sheeting affixed to rails or purlins. The roof is similarly clad with ridge, flashing and eaves trims. Height of housing structure is typically 7.0m with two floors. Floor construction is commonly chequer plate floor on treated timber joists fixed between steel frame members. Stairs or access ladders need to be added as applicable.
