Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	General construction : Excavate for base slab, earthwork support, working space, reinforced concrete slab (0.20m thick) on blinded hardcore; reinforced concrete walls (150mm thick) and reinforced concrete roof (250mm thick), including bar reinforcement and associated formwork, including allowance for preliminaries etc.
Referencing details	Costs do not include Asphalt tanking.
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	NOTE: Costs for any lighting, power and ventilation should be added in addition.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Where roof level varies from those shown, costs should be interpolated or extrapolated as appropriate.

Generic Category	Conveyors
CG Code	205E09
Specific	Steel frame supports
Descriptive	Heavy with cover plate
Tech1	Belt width 0.61m
Tech2	Frame width 1.06m
Unit size	-
Unit of measurement	m
ERC	£1,838
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	General construction, 102mm x 51mm x 12.3kg/m Channel section horizontal framework; 80mm x 80mm x 13kg/m cross bracing and cross-rails bracing framework to form 1000mm deep box support at 600mm modules; painted finished or galvanised. NOTE: In some cases there maybe additional cladding to the sides and/or roof, which is an additional cost. A-frame trestles are costed separately under the applicable Cost Guide section.
Referencing details	In all cases the support width is assumed to be 450mm wider than the belt width. The cover plate is assumed to be 2mm thick and of carbon/mild steel. The cover is added over the steel conveyor support, under the belt, to prevent produce from dropping under the belt.
Cost information notes	Light support is assumed 600mm deep whilst heavy support is assumed 1,000mm deep.
rateable element	Unless the conveyor is being rated under Class1 List of Accessories 1 the belt, drive motor and idler sets are not rateable and thus the steel support structure frame will be rateable under Class 4 Table 3 supports.
non rateable element	Belt, motor and idlers (unless rated under List of Accessories 1).
Adjusted Plant and Machinery	NOTE: For walkways over and at the side of the conveyor, carried from the same framework; see Stairways, Ladders and Walkways. For mesh flooring see Floors, GRP or Weldmesh. For cladding see External Walls - cladding.
Number of items adjusted	The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	General construction, 102mm x 51mm x 12.3kg/m Channel section horizontal framework; 80mm x 80mm x 13kg/m cross bracing and cross-rails bracing framework to form 1000mm deep box support at 600mm modules; painted finished or galvanised. NOTE: In some cases there maybe additional cladding to the sides and/or roof, which is an additional cost. A-frame trestles are costed separately under the applicable Cost Guide section.
Referencing details	In all cases the support width is assumed to be 450mm wider than the belt width. The cover plate is assumed to be 2mm thick and of carbon/mild steel. The cover is added over the steel conveyor support, under the belt, to prevent produce from dropping under the belt.
Cost information notes	Light support is assumed 600mm deep whilst heavy support is assumed 1,000mm deep.
rateable element	Unless the conveyor is being rated under Class1 List of Accessories 1 the belt, drive motor and idler sets are not rateable and thus the steel support structure frame will be rateable under Class 4 Table 3 supports.
non rateable element	Belt, motor and idlers (unless rated under List of Accessories 1).
Adjusted Plant and Machinery	NOTE: For walkways over and at the side of the conveyor, carried from the same framework; see Stairways, Ladders and Walkways. For mesh flooring see Floors, GRP or Weldmesh. For cladding see External Walls - cladding.
Number of items adjusted	The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m3
ERC	£755
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The primary use of large, industrial cooling towers is to remove the heat absorbed in the circulating cooling water systems used in power plants, petroleum refineries, petrochemical and natural gas plants. Cooling towers can also be mechanical small-scale roof-top installations or medium-sized packaged units these have a different Cost Guide Code and are referred to as Mechanical draught. The hyperboloid shape is particularly suited to cooling tower construction as the wide base provides a large space for the water and cooling system. The narrowing effect of the tower helps with the laminar flow of the evaporated water as it rises. As the tower widens out at the top, it supports the turbulent mixing as the heated air makes contact with the atmospheric air. These large cooling towers can be up to 200 metres (660 ft) tall and 100 m (320 ft) in diameter. They are constructed as hyperboloid, doubly-curved concrete shell structures supported on a series of concrete struts. The foundations typically consist of an inclined pond wall forming a circular 'tee' beam with a wide concrete strip. The beam acts to resist the lateral load of the tower's shell structure. As well as the 'tee' beam, piled foundations are normally required to minimise differential settlement and reduce the risk of cracking. The cooling system is housed in the tower's base which is typically the bottom 10 metres, the rest of the tower consisting of an empty shell. The water falls and collects in a pond at the base of the tower, formed by a base slab and the pond wall. In natural-draught cooling towers the open structure at the base allows a natural movement of air.
Referencing details	Base Diameter and height of towers required
Cost information notes	The £cost/m² should be applied to an area arrived at by multiplying the base diameter of the tower at the base of the struts by its height above surface level.
rateable element	-
non rateable element	Pipes are non-rateable

Adjusted Plant and Machinery	-

Tech2	-
Unit size	-
Unit of measurement	m3
ERC	£7,379
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Either steel, reinforced concrete or treated timber frame construction, clad with profiled metal or timber and packed with open cell plastic in demountable modules. Some with reinforced concrete pond at the base of the tower. There are two basic types 1) Forced draught has fans mounted on the side. 2) Induced draught has fans mounted horizontally on roof extracting vertically
Referencing details	Measure the effective volume of the tower
Cost information notes	Cost assumes PVC or plastic packing. For tower raised on platforms or stilts add 15% to total cost. Cost assumes good quality water is being cooled. If water is of poor quality or polluted often timber slat packing is used e.g. in steel works or coking plants. Excludes cost of fans

Unit size	-
Unit of measurement	m3
ERC	£3,930
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Either steel, reinforced concrete or treated timber frame construction, clad with profiled metal or timber and packed with open cell plastic in demountable modules. Some with reinforced concrete pond at the base of the tower. There are two basic types 1) Forced draught has fans mounted on the side. 2) Induced draught has fans mounted horizontally on roof extracting vertically
Referencing details	Measure the effective volume of the tower
Cost information notes	Cost assumes PVC or plastic packing. For tower raised on platforms or stilts add 15% to total cost. Cost assumes good quality water is being cooled. If water is of poor quality or polluted often timber slat packing is used e.g. in steel works or coking plants. Excludes cost of fans

Generic Category	Cranes
CG Code	214F07
Specific	Gantry freestanding
Descriptive	10 tonnes
Tech1	Height to Underside of Rail Track
Tech2	5 metres
Unit size	-
Unit of measurement	m
ERC	£2,688
Superseded codes	214F02
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The Overhead crane structure is free standing (not forming an integral part of a building). This item can be found inside or outside a building. For overhead cranes where the structural support is integral with that of the building see 214B- series. The moving traveller is not rateable nor is the lifting gear mechanism. The rail track, supporting beam, vertical stanchions and foundations are rateable. The structure is rateable no matter what the lifting capacity of the beam is. (Contrast this with the beam that is an integral part of the building) The supporting steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and the ERCs provided are all inclusive. The concrete foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate. See Structural Steelwork- supporting structures.
Referencing details	The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached).
Cost information notes	The costs are based on a standard 15m span for the traveller. LINEAR METREAGE is the length of the rail track (or the distance that the crane travels over). (Not always the length of the building) and is NOT the combined length of the two rails.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	It is envisaged that no extra costs to the freestanding prices would be applicable if the freestanding gantry were OUTSIDE.
Photo description	Cranes: Gantry Freestanding The overhead crane structure is free standing (not forming an integral part of a building). This item can be found inside or outside a building.Note: Vertical structural steel support stanchions, horizontal rail beams, and large concrete foundations all rateable Class 4 Table 3. The moving traveller and hoist is not rateable in this situation and is not a Class 3 hoist.

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The Overhead crane structure is free standing (not forming an integral part of a building). This item can be found inside or outside a building. For overhead cranes where the structural support is integral with that of the building see 214B- series. The moving traveller is not rateable nor is the lifting gear mechanism. The rail track, supporting beam, vertical stanchions and foundations are rateable. The structure is rateable no matter what the lifting capacity of the beam is. (Contrast this with the beam that is an integral part of the building) The supporting steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and the ERCs provided are all inclusive. The concrete foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate. See Structural Steelwork- supporting structures.
Referencing details	The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached).
Cost information notes	The costs are based on a standard 15m span for the traveller. LINEAR METREAGE is the length of the rail track (or the distance that the crane travels over). (Not always the length of the building) and is NOT the combined length of the two rails.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	It is envisaged that no extra costs to the freestanding prices would be applicable if the freestanding gantry were OUTSIDE.
Photo description	Cranes: Gantry Freestanding The overhead crane structure is free standing (not forming an integral part of a building). This item can be found inside or outside a building.Note: Vertical structural steel support stanchions, horizontal rail beams, and large concrete foundations all rateable Class 4 Table 3. The moving traveller and hoist is not rateable in this situation and is not a Class 3 hoist.

ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	It is envisaged that no extra costs to the freestanding prices would be applicable if the freestanding gantry were OUTSIDE.
Photo description	Cranes: Gantry Freestanding The overhead crane structure is free standing (not forming an integral part of a building). This item can be found inside or outside a building.Note: Vertical structural steel support stanchions, horizontal rail beams, and large concrete foundations all rateable Class 4 Table 3. The moving traveller and hoist is not rateable in this situation and is not a Class 3 hoist.

Generic Category	Cranes
CG Code	214B01
Specific	Gantry Rails and Supports - Integral
Descriptive	Height to Underside of Rail Track
Tech1	6 metres
Tech2	5 tonnes
Unit size	-
Unit of measurement	m
ERC	£987
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Superseded codes	214B08, 214B14
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Cranes
CG Code	214B38
Specific	Gantry Rails and Supports - Integral
Descriptive	Height to Underside of Rail Track
Tech1	15.24 metres
Tech2	10 tonnes
Unit size	-
Unit of measurement	m
ERC	£1,488
Superseded codes	214B26, 214B32
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).

As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Cranes
CG Code	214B75
Specific	Gantry Rails and Supports - Integral
Descriptive	Height to Underside of Rail Track
Tech1	24.38 metres
Tech2	15 tonnes
Unit size	-
Unit of measurement	m
ERC	£2,018
Superseded codes	214B63, 214B69
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).

As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

CG Code	214BAK
Specific	Gantry Rails and Supports - Integral
Descriptive	Height to Underside of Rail Track
Tech1	15.24 metres
Tech2	40 tonnes
Unit size	-
Unit of measurement	m
ERC	£2,459
Superseded codes	214BAB, 214BAF
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).

The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Cranes
CG Code	214BBZ
Specific	Gantry Rails and Supports - Integral
Descriptive	Height to Underside of Rail Track
Tech1	24.38 metres
Tech2	40 tonnes
Unit size	-
Unit of measurement	m
ERC	£3,056
Superseded codes	214BBL, 214BBS
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit of measurement	m
ERC	£3,793
Superseded codes	214BDH
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).

The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element. Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.
Referencing details	Moving beam buffers These may be of various lengths and where two travellers work the same beam they prevent the two beams from coming to close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take look at SWL indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beams SWL.

Cost information notes	The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.
rateable element	Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2
non rateable element	Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes
Adjusted Plant and Machinery	Moving Traveller (Class 1 and Class 2).
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Cranes
CG Code	214M02
Specific	Moving Traveller 15m span
Descriptive	10 tonne
Tech1	Height to underside of rail
Tech2	5 metres
Unit size	Each
Unit of measurement	Each
ERC	£26,005
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	See variations section notes. This item will mainly be for coal fired boilers although some travellers are found in electrical generation and compressor areas used for maintenance purposes. The cost for the moving traveller should only be considered for included in the assessment when looking at an item under Class 1, Table 1, which is used in preparing or storage of fuel for the Class 1 item The costs do not include the structural support and rail track. The costs do not include the moving lifting parts and motors driving them.
Referencing details	The lifting capacity of the crane is required and is usulaay stated on the travelling beam. Record travelling beam span and lift height. Costs assume 5 metre height to underside of gantry and 15m span.
Cost information notes	The lifting capacity of the crane is required and is usually stated on the travelling beam. Record travelling beam span and lift height. Costs assume 5 metre height to underside of gantry and 15m span.

(Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	It is assumed that no additional costs would be applicable if the traveller was situated outside.

Generic Category	Cranes
CG Code	214M04
Specific	Moving Traveller 15m span
Descriptive	20 tonne
Tech1	Height to underside of rail
Tech2	5 metres
Unit size	Each
Unit of measurement	Each
ERC	£41,021
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	See variations section notes. This item will mainly be for coal fired boilers although some travellers are found in electrical generation and compressor areas used for maintenance purposes. The cost for the moving traveller should only be considered for included in the assessment when looking at an item under Class 1, Table 1, which is used in preparing or storage of fuel for the Class 1 item The costs do not include the structural support and rail track. The costs do not include the moving lifting parts and motors driving them.
Referencing details	This code covers the moving traveller only.
Cost information notes	The lifting capacity of the crane is required and is usually stated on the travelling beam. Record travelling beam span and lift height. Costs assume 5 metre height to underside of gantry and 15m span.
rateable element	The cost for the moving traveller should only be considered for included in the assessment when looking at an item under Class 1, Table 1, which is used in preparing or storage of fuel for the Class 1 item
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	See separate codes for alternative sizes and for buried pipes.

Generic Category	District heating pipework
CG Code	216P19
Specific	Insulated Pipe 100mm
Descriptive	Hot Water Distribution Pipe
Tech1	Integral Insulation
Tech2	Buried in hard ground
Unit size	Per linear m
Unit of measurement	m
ERC	£574
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Hot Water Distribution Pipe
Referencing details	Measure the pipe run in metres. If pipes are out of sight obtain details from the scheme operator. Includes fittings.
Cost information notes	See separate Cost Guide entries for pipes buried in the ground. For projects under 100m in length add 35%. Cost given is per m for a single pipe run.
rateable element	Pipes per Class 3 (g)
non rateable element	-
Adjusted Plant and Machinery	Refer to Rating Manual Section 5a Valuation of all property classes : District Heating Undertakings.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. Adjusted Plant and Machinery	Refer to Rating Manual Section 5a Valuation of all property classes : District Heating Undertakings.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	See separate codes for alternative sizes and for buried pipes.

Generic Category	District heating pipework
CG Code	216P17
Specific	Insulated Pipe 65mm
Descriptive	Hot Water Distribution Pipe
Tech1	Integral Insulation
Tech2	Buried in hard ground
Unit size	Per linear m
Unit of measurement	m
ERC	£491
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Hot Water Distribution Pipe
Referencing details	Measure the pipe run in metres. If pipes are out of sight obtain details from the scheme operator. Includes fittings.
Cost information notes	See separate Cost Guide entries for pipes buried in the ground. For projects under 100m in length add 35%. Cost given is per m for a single pipe run.
rateable element	Pipes per Class 3 (g)
non rateable element	-
Adjusted Plant and Machinery	Refer to Rating Manual Section 5a Valuation of all property classes : District Heating Undertakings.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	Generally detached single-storey building comprising training workshops for construction or mechanical trades alongside ancillary accommodation including toilet facilities, staff offices, stores and plant rooms. Minimal basic classroom provision may also be present. Commonly of framed construction with a range of cladding to elevations surmounted by a composite metal panel clad pitched roof. Roller shutter doors frequently present. Internal finishes and fixtures vary depending on accommodation usage with painted blockwork walls, exposed concrete floors and exposed underside of roof common to workshop areas. Services comprise central heating (radiant panels typical to workshop areas), ventilation and dust extraction, lighting and power, sanitary and plumbing installations and limited communication and security installations including fire detection and alarm systems. In addition, various sustainable features, such as photovoltaic panels, may be present.

Generic Category	Electrics
CG Code	206G01
Specific	Batteries
Descriptive	12 volt
Tech1	Found individually or in sets of up to 6
Tech2	-
Unit size	-
Unit of measurement	Each
ERC	£220
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	-
Referencing details	The batteries must be static for power purposes only. Record the following details, 1. Use of batteries, 2. Voltage of batteries, 3. Capacity of batteries in Amp Hours (Ah), 4. Number of batteries connected together, 5. Age.
Cost information notes	12 volt batteries are usually found in sets of up to six. 2 voly batteries are usually found in sets of one hundred plus. Cables connecting the individual batteries or cells together are included in the cost, but cables to other plant and machinery are not and should be costed separately.
rateable element	Class 1 Table 1 (d) List of accessories 2 (vii) (viii)
non rateable element	If battery is an integral part of a machine that is regularly removed from the hereditament.
Adjusted Plant and Machinery	Engines, foundations, cables
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Location factor	Considered Not Applicable at time of Publication
Description	Generally batteries that are rateable have two types of use. Either for supplying power to start standby generators or to provide power over a longer period to keep important electrical systems opeerational e.g. teelephone switchboards or computer systems. they are also used for storing power in 'off-grid' renewble energy systems where the power is typically generated by solar panels or wind. Batteries used for starting standby generators are similar to the batteries used in commercial vehicles and look like a standard car battery but are physiclly larger. They have a 12 volt rating. Batteries used for other power purposes are generally 2 voly cells connected together to provide the required voltage and storage capacity. Frequently these are in racks or sets of 100 plus cells. The costings are based on a typical battery with a capacity of 925 amp hour for the 2 volt battery and 140 amp hour for the 12 volt battery.
Referencing details	The batteries must be static for power purposes only. Record the following details, 1. Use of batteries, 2. Voltage of batteries, 3. Capacity of batteries in Amp Hours (Ah), 4. Number of batteries connected together, 5. Age.

Description	High Voltage Cables are rateable under Class 1 Table 1 (f) Cables ..... and Class 2 List of Accessories 2 (vii). The cables are made from a copper core, which is surrounded in e.g. paper / resin which acts as an insulator. Around this insulation is woven a lead " cloth " which acts as protection / support. Finally there is a plastic cover (usually black) which adds water protection. It is usually the larger cables (both in physical size and capacity carried) that are noted as rateable. Rateable cables are usually from the boundary fence / generator to the transformer or distribution board. Cables run inside building in cable trays whereas most external cables run underground in a sand trench. The actual cable is often in a clayware duct. Typical sizes 3800/6600V, 6350/11000V, 8700/15000V, 12700/22000V, 19000/33000V. Types of construction - Single core cable: copper wire screened, un-armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, semi-conductor tape, copper wire screen, PVC over-sheath Single core cable: copper tape screened, aluminium wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, PVC sheath, aluminium wire armou,r PVC over-sheath. Three core cable: copper tape screened, single wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, Non-hygroscopic filler, synthetic tape PVC sheath, galvanized steel wire armour, PVC over-sheath.
Referencing details	Where runs are not available adopt 250 m run per circuit.
Cost information notes	Cost are based on 1000m run of cabling Cable costs are for :-Cables in support trays or attached to walls (normal) Cables in a trench underground. (across site or building to building) Cables in a concrete duct with metal top (inside power house / switch room)

Description	High Voltage Cables are rateable under Class 1 Table 1 (f) Cables ..... and Class 2 List of Accessories 2 (vii). The cables are made from a copper core, which is surrounded in e.g. paper / resin which acts as an insulator. Around this insulation is woven a lead " cloth " which acts as protection / support. Finally there is a plastic cover (usually black) which adds water protection. It is usually the larger cables (both in physical size and capacity carried) that are noted as rateable. Rateable cables are usually from the boundary fence / generator to the transformer or distribution board. Cables run inside building in cable trays whereas most external cables run underground in a sand trench. The actual cable is often in a clayware duct. Typical sizes 3800/6600V, 6350/11000V, 8700/15000V, 12700/22000V, 19000/33000V. Types of construction - Single core cable: copper wire screened, un-armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, semi-conductor tape, copper wire screen, PVC over-sheath Single core cable: copper tape screened, aluminium wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, PVC sheath, aluminium wire armou,r PVC over-sheath. Three core cable: copper tape screened, single wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, Non-hygroscopic filler, synthetic tape PVC sheath, galvanized steel wire armour, PVC over-sheath.
Referencing details	Where runs are not available adopt 250 m run per circuit.
Cost information notes	Cost are based on 1000m run of cabling Cable costs are for :-Cables in support trays or attached to walls (normal) Cables in a trench underground. (across site or building to building) Cables in a concrete duct with metal top (inside power house / switch room)
rateable element	Class 1 Table 1 (f) Cables and Conductors Class 1 and 2 - List of Accessories (2) (vii) cables, wires
non rateable element	-
Adjusted Plant and Machinery	Switches, Transformers, Bus Bar (distribution board.)

Number of items adjusted	It is assumed that the item forms part of an "average size industrial, commercial or office complex". Where it would be normal to find more than one item in such a hereditament the ERC stated has been adjusted to reflect any number / quantity, discount. These figures are NOT one off figures.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	High Voltage Cables are rateable under Class 1 Table 1 (f) Cables ..... and Class 2 List of Accessories 2 (vii). The cables are made from a copper core, which is surrounded in e.g. paper / resin which acts as an insulator. Around this insulation is woven a lead " cloth " which acts as protection / support. Finally there is a plastic cover (usually black) which adds water protection. It is usually the larger cables (both in physical size and capacity carried) that are noted as rateable. Rateable cables are usually from the boundary fence / generator to the transformer or distribution board. Cables run inside building in cable trays whereas most external cables run underground in a sand trench. The actual cable is often in a clayware duct. Typical sizes 3800/6600V, 6350/11000V, 8700/15000V, 12700/22000V, 19000/33000V. Types of construction - Single core cable: copper wire screened, un-armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, semi-conductor tape, copper wire screen, PVC over-sheath Single core cable: copper tape screened, aluminium wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, PVC sheath, aluminium wire armou,r PVC over-sheath. Three core cable: copper tape screened, single wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, Non-hygroscopic filler, synthetic tape PVC sheath, galvanized steel wire armour, PVC over-sheath.
Referencing details	Where runs are not available adopt 250 m run per circuit.
Cost information notes	Cost are based on 1000m run of cabling Cable costs are for :-Cables in support trays or attached to walls (normal) Cables in a trench underground. (across site or building to building) Cables in a concrete duct with metal top (inside power house / switch room)
rateable element	Class 1 Table 1 (f) Cables and Conductors Class 1 and 2 - List of Accessories (2) (vii) cables, wires
non rateable element	-
Adjusted Plant and Machinery	Switches, Transformers, Bus Bar (distribution board.)

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

CG Code	207D03
Specific	Diesel Engine - Alternator - Set 1100rpm
Descriptive	1152kW (M) of engine
Tech1	Free standing - 50Hz 415V alternator
Tech2	1270kVA alternator
Unit size	-
Unit of measurement	Each
ERC	£539,216
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Variations

Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Generic Category	Electrics
CG Code	207D10
Specific	Diesel Engine - Alternator - Set 1500rpm
Descriptive	Free standing - 50Hz 11kV alternator
Tech1	No engine details
Tech2	150kVA alternator
Unit size	-
Unit of measurement	Each
ERC	£51,766
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Generic Category	Electrics
CG Code	207D18
Specific	Diesel Engine - Alternator - Set 1500rpm
Descriptive	Free standing - 50Hz 11kV alternator
Tech1	No engine details
Tech2	1250kVA alternator
Unit size	-
Unit of measurement	Each
ERC	£414,313
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

CG Code	207D81
Specific	Diesel Engine - Alternator - Set 1500rpm
Descriptive	Free standing - 50Hz 415V alternator
Tech1	218kW(M) of engine
Tech2	275kVA alternator
Unit size	-
Unit of measurement	Each
ERC	£78,293
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Generic Category	Electrics
CG Code	207D90
Specific	Diesel Engine - Alternator - Set 1500rpm
Descriptive	Free standing - 50Hz 415V alternator
Tech1	674kW(M) of engine
Tech2	800kVA alternator
Unit size	-
Unit of measurement	Each
ERC	£172,282
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Description	Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-

In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Generic Category	Electrics
CG Code	207D53
Specific	Diesel Engine - Alternator - Set 1500rpm
Descriptive	In acoustic box - 50Hz 415V alternator
Tech1	44kW (M) of engine
Tech2	35kVA alternator
Unit size	-
Unit of measurement	Each
ERC	£26,471
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Generic Category	Electrics
CG Code	207D61
Specific	Diesel Engine - Alternator - Set 1500rpm
Descriptive	In acoustic box - 50Hz 415V alternator
Tech1	304kW (M) of engine
Tech2	275kVA alternator
Unit size	-
Unit of measurement	Each
ERC	£75,490
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.
Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Referencing details	1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.
Cost information notes	Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.
rateable element	Class 1 Table 1(b) internal combustion engines and (l)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.
Photo description	Diesel engine and alternator (SET) Comprising diesel engine, shafting and alternator sitting on a metal support frame (skid).
Photo notes	Photo 1- Acoustic box showing silencer on top and air intake grill to right. Photo 2 - Diesel engine with battery for starting with alternator to left hand side. Photo 3 - Diesel Alternator set in a basement- (not in acoustic box)

Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.
Cost information notes	-

Descriptive	Air Circuit Breaker Voltage 11kV
Tech1	Breaking Capacity 500MVA
Tech2	Amps 1,250
Unit size	-
Unit of measurement	Each
ERC	£10,415
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.
Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.
non rateable element	After first distribution board - see note in rateable element.
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 800 amp. Age. Indoors or outdoors.
Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If in different location but still qualifies as the first switch after the distribution board then not rateable.
non rateable element	After first distribution board - see note in rateable element.
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Referencing details	Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.
Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.
non rateable element	After first distribution board - see note in rateable element.
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.

Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 3.3kV, Breaking capacity i.e. MVA, Current (amps) i.e.630 amp. Age. Indoors or outdoors.
Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If in different location but still qualifies as the first switch after the distribution board then not rateable.
non rateable element	After first distribution board - see note in rateable element.

Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 3.3kV, Breaking capacity i.e. MVA, Current (amps) i.e.1,600 amp. Age. Indoors or outdoors.
Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If in different location but still qualifies as the first switch after the distribution board then not rateable.
non rateable element	After first distribution board - see note in rateable element.
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.
Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.
non rateable element	After first distribution board - see note in rateable element.
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.
non rateable element	After first distribution board - see note in rateable element.
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.

(Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.
Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.
non rateable element	After first distribution board - see note in rateable element.
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Description	A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed in new systems.
Referencing details	Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.
Cost information notes	-
rateable element	A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.
non rateable element	After first distribution board - see note in rateable element.
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Cost information notes	-
rateable element	Class 1 Table 1 (e) Main transmission of power - Class 1(i) (in the case of electrical power, the first distribution board). Transformer
non rateable element	If part of process e.g. Electric Arc Furnace Transformer
Adjusted Plant and Machinery	Cables and conductors, switch boards, distribution boards, control panels, and all switchgear and other apparatus thereon.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Transformers 11kV to 415 V The most common rateable transformer sitting inside the boundary fence and dropping the voltage down to 415 v before the first distribution board. This size of transformer may be inside (as part of the switch house) or outside in a pen or behind safety fencing.
Referencing details	Transformers are dangerous. Do not get too close and only under supervision. Most have a plate on them giving the kVa and the upper and lower voltage. Ask the engineer for a SCHEMATIC in order to work out if they are rateable or not.
Cost information notes	-

non rateable element	If part of process e.g. Electric Arc Furnace Transformer
Adjusted Plant and Machinery	Cables and conductors, switch boards, distribution boards, control panels, and all switchgear and other apparatus thereon.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Electrics
CG Code	206A39
Specific	Transformer
Descriptive	20kV-3.3kV
Tech1	Indoor and Outdoor Installation
Tech2	4000kVA
Unit size	Each
Unit of measurement	Each
ERC	£142,982
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A transformer changes an AC (alternating current) from one voltage to another, here 20,000V to 3,300V They are only found in large heavy works, either in an external pen behind safety fencing or within the switch house.
Referencing details	Transformers are dangerous. Do not get too close and only under supervision. Most have a plate on them giving the kVa and the upper and lower voltage. Ask the engineer for a SCHEMATIC in order to work out if they are rateable or not.
Cost information notes	-
rateable element	Class 1 Table 1 (e) Main transmission of power - Class 1(i) (in the case of electrical power, the first distribution board). Transformer
non rateable element	If part of process e.g. Electric Arc Furnace Transformer
Adjusted Plant and Machinery	Cables and conductors, switch boards, distribution boards, control panels, and all switchgear and other apparatus thereon.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

(Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Electrics
CG Code	206A13
Specific	Transformer
Descriptive	33kV-11kV
Tech1	Indoor and Outdoor Installation
Tech2	500kVA
Unit size	Each
Unit of measurement	Each
ERC	£300,711
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Transformers 33kV to 11kV The most common large rateable transformer sitting inside the boundary fence and dropping the voltage down to 11kV before the first distribution board. These are only found in large heavy works. This size of transformer may be inside (as part of the switch house) or outside in a pen or behind safety fencing.
Referencing details	Transformers are dangerous. Do not get too close and only under supervision. Most have a plate on them giving the kVa and the upper and lower voltage. Ask the engineer for a SCHEMATIC in order to work out if they are rateable or not.
Cost information notes	-
rateable element	Class 1 Table 1 (e) Main transmission of power - Class 1(i) (in the case of electrical power, the first distribution board). Transformer
non rateable element	If part of process e.g. Electric Arc Furnace Transformer
Adjusted Plant and Machinery	Cables and conductors, switch boards, distribution boards, control panels, and all switchgear and other apparatus thereon.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Generic Category	Electrics
CG Code	206M01
Specific	Wind Turbine and Solar Panel
Descriptive	Wind turbine 250W Solar Panel 250W
Tech1	Stayed monopole support
Tech2	Turbine blade up to 1m
Unit size	Each
Unit of measurement	Each
ERC	£4,421
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Small combined turbine and solar installation affixed to a monopole, typically found in remote sites where access to a small power supply is needed. The turbine produces up to 250W in windy conditions, the solar panel produces a charge when there is sufficient solar luminosity rated at 250w. There is a battery included with the installation which is trickle charged by the turbine and panel. An inverter is included to convert direct to alternating current
Referencing details	See photo herewith and compare to installation on site. This cost code is for the very small turbines supported by a short stayed pole and of 12V / 24V circa 250W output. The solar panel will usually be around 1m tall by 1.6m wide. Larger wind turbines and multiple solar panel installations are covered elsewhere in the Cost Guide.
Cost information notes	This cost code is for the very small turbines supported by a short stayed pole and of 12V / 24V circa 250W output. The solar panel will usually be around 1m tall by 1.6m wide. Larger wind turbines and multiple solar panel installations are covered elsewhere in the Cost Guide.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Cost is a unit rate so size variations can be accommodated by pro rata.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Fire protection
CG Code	208P01
Specific	Diesel engine - pump
Descriptive	Engine and pump set
Tech1	-
Tech2	-
Unit size	Each
Unit of measurement	Each
ERC	£160,110
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Water pumps and diesel engine together with valves and automatic control operate as a set; to serve firewater header tank to deliver required pressure and volume of water to sprinkler system. Usually tank and pump system is situated outside the main building but can be on the roof . Usually system is painted RED
Referencing details	To be costed with full sprinkler system. including for Pump/engine set.
Cost information notes	To be costed in addition to a sprinkler system and water storage / supply tanks.
rateable element	Class 2 Table 2 (f) Protection from Hazards fire or other hazard. Hydrants, Monitors.
non rateable element	-
Adjusted Plant and Machinery	Pumps, tanks, pipes, fire alarm systems. Inert gas systems.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	See 208A60 for an electric pump set.

Generic Category	Fire protection
CG Code	208B07
Specific	Fire Hydrants
Descriptive	Monitor
Tech1	Foam
Tech2	100mm lbs/in² - 100mm inlet. 330 gallons/min - 360 deg blabbermouth
Unit size	Each
Unit of measurement	Each
ERC	£11,865
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	MONITOR - A device with a nozzle. The whole unit can be hand turned by a metal extension bar. The nozzle and control either fit over the top of the rising main in one unit or form part of a normal hydrant with a 90 degree upwards turn to take the monitor. The Rose can be adjusted to ensure a spray mist if required or a powerful water jet. Normal pressure is 100-150 psig whilst high pressure is regarded as 250 psig. Monitors may deliver foam instead of water.
Referencing details	Number of hydrants or monitors around the site.
Cost information notes	Code Fire Monitors (Hydrants) - Foam/Water Monitor 100mm lb/sq in 100mm inlet 330 gals/minute Rotation 360 degree with blabbermouth Cost does not include water storage tanks or water pumps. The fire hydrant is adapted to have a monitor fitted onto it. Usually both hydrant and monitor are permanently fixed on site.

ERC	£260
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks for storing water ready for use with a fire fighting system.
Referencing details	Calculate the cubic capacity of the tank.
Cost information notes	Cost figures are generally marginally below that of a refinery tank to reflect bolted construction and slightly lower specifications. Add for foundations, the amount will depend upon specific installation factors.
rateable element	Class 2 Table 2 (f) Protection from Hazards fire and explosion - fire protection (List of Accessories 2 (v) tanks)
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Fire protection
CG Code	208T23
Specific	Firewater header tank
Descriptive	Excludes foundation
Tech1	12000m³
Tech2	-
Unit size	m3
Unit of measurement	m3
ERC	£75
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks for storing water ready for use with a fire fighting system.
Referencing details	Calculate the cubic capacity of the tank.
Cost information notes	Cost figures are generally marginally below that of a refinery tank to reflect bolted construction and slightly lower specifications. Add for foundations, the amount will depend upon specific installation factors.
rateable element	Class 2 Table 2 (f) Protection from Hazards fire and explosion - fire protection (List of Accessories 2 (v) tanks)
non rateable element	-
Adjusted Plant and Machinery	It is assumed that the item forms part of an "average size specialist industrial complex". Where it would be normal to find more than one item like pumps, generators etc.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Fire protection
CG Code	208A22
Specific	Firewater header tank
Descriptive	Including pump set + pipes
Tech1	Average cost where details unknown
Tech2	Serving up to 100 sprinkler heads
Unit size	Each
Unit of measurement	Each
ERC	£140,966
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Water pumps and engine together with valves and automatic control to serve firewater header tank to deliver required pressure and volume of water to sprinkler system. Usually tank and pump system is situated outside the main building but can be on roof in some circumstances. Usually system is painted RED
Referencing details	-
Cost information notes	Apply where full details of system are unknown. This is an average cost for tank, pumps, engine and distribution pipework. Cost excludes sprinkler heads, detection and alarm. Add for sprinkler system per 208D01 at 950 per sprinkler head.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	Sprinkler heads, fire detection and alarm system.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land).
