Location factor	Considered Not Applicable at time of Publication
Description	Tanks for storing water ready for use with a fire fighting system.
Referencing details	Note capacity of tank and dimensions where possible. Note pump rooms or chambers and sizes. Age
Cost information notes	Underground water storage tanks are usually rectangular and are often Braithwaite type tanks. Pump rooms and pumps also can be underground
rateable element	Class 2 Table 2 (f) Protection from Hazards fire and explosion - fire protection (List of Accessories 2 (v) tanks)
non rateable element	-
Adjusted Plant and Machinery	Add for pit in which the tank sits.
Number of items adjusted	It is assumed that the item forms part of an average size specialist industrial complex. Where it would be normal to find more than one item in such a hereditament the ERC stated has been adjusted to reflect any number, quantity discount These figures are NOT one off figures.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	In many specialist areas water is not an appropriate medium especially where electrical or sensitive items are stored. Over the years various inert gases have been used and the heavier inert gases are preferred. CO2 is often employed in areas where humans do not work but where the workforce is employed Argon is the most popular gas. The gas is stored in pressure vessels and when released forms a gas blanket which drops to the floor of the building and knocks out oxygen. The costs for the pipes and the heads is the same as for water sprinkler systems (see appropriate section) Once the system has been discharged it has to be re charged
Referencing details	Record medium of protection used, storage vessels , sizes and age Where appropriate - number of outlets.
Cost information notes	Location within industrial complex - Argon Gas Control Room 185.6m2 x 3.5m high (main control room with computer control systems) Based on floor area. To include tanks, electrical detection system, pipes, and pipe supports, heads, installation and controls including alarms.

Description	The assumption is that the pressure in the street mains is sufficient to supply the whole system continuously (or until the fire engines arrive). Costs are based on the number of heads. This includes:- mains pipes from the boundary fence to the building, control and regulation valves including gauges and dials, mains pipework (and supports) throughout the buildings, branch pipework (and supports) and the head mechanism itself. Also included are the detection devices, alarm systems and the computer control / display equipment. The type of goods / assets being protected are assessed and the number of heads are calculated to suit BS 5306 Part 2 1990. Mains street supply with no extra pumping is assumed. (i) High Hazard Class :- Occupancies 97 sq ft (9m2) per head e.g. chemical work, petrol storage. (ii) Ordinary Hazard Class :- Occupancies 130 sq ft (12m2) per head e.g. factories, offices, shops. (iii) Light Hazard Class :- Occupancies 225 sq ft (21m2) per head e.g. steel stockholders, warehousing of inert materials. The greater the Hazard rating the more densely the bulbs are located and thus the greater number required. The heads become active when the heat from below a certain section is so great it expands the liquid held in the glass head bulb whereupon the bulb breaks. This allows the water to flow - the water hits the star shaped device fitted above the bulb whereupon the water forms a shower. In many cases the bulbs released at any one time may be restricted thus not causing undue water damage. The system may have water behind the bulb but in many cases, especially in shops and offices the system is dry - air holds back the water. The release of the bulb allows the water behind the air to drive it out and spray water as normal. In many cases a control "a dry riser" can be noted. The water requirement for over 100 heads is significant.
Referencing details	Count or estimate the total number of heads served by one mains connection (there may be more than one building on site). NB there may be more than one mains connection
Cost information notes	Where firewater header tanks are employed, pumps etc see Cost Guide for additional costings. High Hazard Class may require these extra facilities. This addition is usually applied where a life safety situation arises e.g.. shops, offices, hotels
rateable element	Class 2 Table 2 (f) Protection from Hazards fire and explosion protection and suppression systems. List of Accessories 2 (i) to (viii) incl

non rateable element	-
Adjusted Plant and Machinery	Fire ring mains, firewater header tanks, firewater pump sets, fire alarm systems (no sprinklers)
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	Sprinkler head and pipe work within a factory building. Automatic fire detectors / smoke detectors. Each system is designed for the type of building in which it is to be used and the type of materials being protected. BS 5306 Part 2 1990. (1) High Hazard Class: Occupancies 97 sq ft (9m2) per head e.g. chemical work, petrol storage. (2) Ordinary Hazard Class: Occupancies 130 sq ft (12m2) per head e.g. factories, offices, shops. (3) Light Hazard Class: Occupancies 225 sq ft (21m2) per head e.g. steel stockholding warehouse. In (2) older ordinary hazard class systems usually the town water supply is adequate. However the widespread reduction of town water main pressure has meant that most modern ordinary hazard systems now demand tanks and pump backup system. Assume all modern systems require an addition for a tank, pumps and mains connection pipes unless informed otherwise. For (1) extra high hazard class a pump and tank system is required and a separate addition should be made for this item in all cases. All detection systems of control electrics, pipes and alarms are included in the costs. Town Water only systems are not suitable for life safety applications i.e. as in hotels, offices and shops. Terms: Wet System: Water is in pipe up to sprinkler head at all times. Dry System: Pipe work is charged with air to prevent water lying in pipes used in cold stores or areas where frost damage could occur.
Referencing details	Count or estimate number of heads based on area
Cost information notes	Normal Stacking. Normal height stacking. Fire risk low. Ordinary hazard. Mains water supply. Individual head glass bulb detection. One head every 10m2 - 12m2. The water mains from the town supply to the building and the pipe work in the building is included in these costs. Where applicable the pipe work from a storage tank to the building is included in the costs. Where a ring main is employed or branch mains to items of rateable plant a separate figure is required for the pipe work. Concrete foundations to tanks, motors and pumps are additional costs, as are costs for, insulation to pipes, pipe racks and pipe supports. All these items are to be rated under Class 2 and List of Accessories 2. (i) to (viii)

Generic Category	Fire protection
CG Code	208A05
Specific	Water sprinklers - mains supply
Descriptive	Normal stacking - low risk
Tech1	Sophisticated alarm - detection system
Tech2	Over 100 heads
Unit size	Each
Unit of measurement	Each
ERC	£461
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Sprinkler head and pipe work within a factory building. Automatic fire detectors / smoke detectors. Each system is designed for the type of building in which it is to be used and the type of materials being protected. BS 5306 Part 2 1990. (1) High Hazard Class: Occupancies 97 sq ft (9m2) per head e.g. chemical work, petrol storage. (2) Ordinary Hazard Class: Occupancies 130 sq ft (12m2) per head e.g. factories, offices, shops. (3) Light Hazard Class: Occupancies 225 sq ft (21m2) per head e.g. steel stockholding warehouse. In (2) older ordinary hazard class systems usually the town water supply is adequate. However the widespread reduction of town water main pressure has meant that most modern ordinary hazard systems now demand tanks and pump backup system. Assume all modern systems require an addition for a tank, pumps and mains connection pipes unless informed otherwise. For (1) extra high hazard class a pump and tank system is required and a separate addition should be made for this item in all cases. All detection systems of control electrics, pipes and alarms are included in the costs. Town Water only systems are not suitable for life safety applications i.e. as in hotels, offices and shops. Terms: Wet System: Water is in pipe up to sprinkler head at all times. Dry System: Pipe work is charged with air to prevent water lying in pipes used in cold stores or areas where frost damage could occur.
Referencing details	Count or estimate number of heads based on area
Cost information notes	Normal Stacking. Normal height stacking. Fire risk low. Ordinary hazard. Mains water supply. Individual head glass bulb detection. One head every 10m2 - 12m2. The water mains from the town supply to the building and the pipe work in the building is included in these costs. Where applicable the pipe work from a storage tank to the building is included in the costs. Where a ring main is employed or branch mains to items of rateable plant a separate figure is required for the pipe work. Concrete foundations to tanks, motors and pumps are additional costs, as are costs for, insulation to pipes, pipe racks and pipe supports. All these items are to be rated under Class 2 and List of Accessories 2. (i) to (viii)
rateable element	Class 2 Table 2 (f) Protection from Hazards List of accessories 2(i), (v), (vii), (viii)

Location factor	Considered Not Applicable at time of Publication
Description	Vertical flare stacks are used to safely burn off un-wanted gas. They can be found at sewage treatment works, landfill sites and petro chemical facilities. It should be noted that vertical stacks with open flames are no longer compliant on landfill sites, but can still be used in other situations
Referencing details	The type of installation should be recorded i.e. sewage treatment works / landfill etc. The pressure and flow rate should also be recorded. For vertical stack flares the dimensions of the stack should be recorded.
Cost information notes	The indicative cost is for a stack of around 8m to 10m height as typically found at sewage treatment works. Installed cost includes foundations. Cost may not be suitable for significantly larger stacks typically found at petro chemical works
rateable element	Class 2 Table 2 (f) PROTECTION FROM HAZARDS Fire and explosion protection and suppression systems List of Accessories 2 (i) - (viii
non rateable element	-
Adjusted Plant and Machinery	Gas holders, gas turbines, gas engines,
Number of items adjusted	The item can typically be found on a specialist industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.The item can typically be found on a specialist industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Tech1	6mm thick chequer plate
Tech2	3.5m between floors
Unit size	-
Unit of measurement	m2
ERC	£518
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Reinforced concrete frame with 6mm thick Chequer/Dunbar plate flooring, 3.5m above level of floor below (i.e. floor to floor). Excludes foundation bases.
Referencing details	Measure area of supported floor = m2.
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Descriptive	Excluding supporting structure
Tech1	200mm thick slab
Tech2	6m - 7.5m to soffit
Unit size	-
Unit of measurement	m2
ERC	£143
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Reinforced concrete upper floors, rate excludes supporting structure.
Referencing details	Measure floor area =m2.
Cost information notes	Additional cost of steel deck permanent shuttering left in use code 30A04V1
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Add or deduct for each metre variation in height for below 20m - 30A04V2, for above 20m in height use code 30A04V3. For handrails and access stairs see Stairs.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Tech1	$0.1m^3$ - $0.5m^3$
Tech2	-
Unit size	-
Unit of measurement	m3
ERC	£1,631
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Reinforced concrete machine bases, above ground level, often found inside factory/industrial buildings. Includes basic finish formwork, reinforcement & tamped finish. Based on a machine base 5m x 1m x 0.10m deep
Referencing details	Calculate volume - length x width x depth of base
Cost information notes	Price includes for volume of foundation below ground level
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	Bored cast insitu reinforced concrete piles between 300 and 600mm diameter to maximum depth of 30m on a clear site with reasonable access. The installation covers the provision of the boring rig and its removal and transfer between points on site. The cost of the pile is based on a typical depth and disposal of excavated inert waste material. There will be a pile cap for each pile or combination of piles. The size and depth of piling is entirely dependent upon the loading being imposed and the bearing capacity of the ground upon which the structure is being built. In order to obtain the most accurate estimate of cost then details must be obtained from the actual piling records.
Referencing details	Based on diameter and depth of piles.
Cost information notes	Each pile or combination of piles will be constructed with a pile cap to assist transfer of loads to the pile from the foundations and the structures above. Piles a may be grouped in 2,3 4 or 6 concentrations and linked with a single pile cap. Costs are per pile

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Bored cast insitu reinforced concrete piles between 300 and 600mm diameter to maximum depth of 30m on a clear site with reasonable access. The installation covers the provision of the boring rig and its removal and transfer between points on site. The cost of the pile is based on a typical depth and disposal of excavated inert waste material. There will be a pile cap for each pile or combination of piles. The size and depth of piling is entirely dependent upon the loading being imposed and the bearing capacity of the ground upon which the structure is being built. In order to obtain the most accurate estimate of cost then details must be obtained from the actual piling records.
Referencing details	-
Cost information notes	Each pile or combination of piles will be constructed with a pile cap to assist transfer of loads to the pile from the foundations and the structures above. Piles a may be grouped in 2,3 4 or 6 concentrations and linked with a single pile cap. Costs are per pile
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Furnaces
CG Code	209S10
Specific	Annealing
Descriptive	Batch
Tech1	6m x 6m x 18m length
Tech2	Volume 648m3
Unit size	-
Unit of measurement	m3
ERC	£2,543
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Annealing furnaces operate up to 750°C and then the product is cooled by a controlled release of heat. They can be very large and can have the hearth built on a platform bogie running on rails and moved via pulleys and cables. For smaller products the items are loaded into a fixed bed furnace using a mechanised furnace charger. For thin strip steel annealing (usually in a roll) it is undertaken in a continuous process and with the de-greasing lines these furnaces are often vertical. Annealing furnaces are not so dense in structure in respect of brickwork and refractories as they are not built to withstand or retain as much heat. The brickwork and ceramic tiles (sometimes fibre quilt) are not so expensive per m3 to purchase or install. Bogie furnaces are usually built up from the concrete base and thus even under size are unlikely to be capable of removal (Class 4(d)). The hearth is not rateable in these cases. Modern furnaces are built within a steel support frame
Referencing details	-
Cost information notes	Includes refractory linings

For thin strip steel annealing (usually in a roll) it is undertaken in a continuous process and with the de-greasing lines these furnaces are often vertical. Annealing furnaces are not so dense in structure in respect of brickwork and refractories as they are not built to withstand or retain as much heat. The brickwork and ceramic tiles (sometimes fibre quilt) are not so expensive per m3 to purchase or install. Bogie furnaces are usually built up from the concrete base and thus even under size are unlikely to be capable of removal (Class 4(d)). The hearth is not rateable in these cases. Modern furnaces are built within a steel support frame

Description	Cabin Heaters are used in the chemical and petrochemical industry to heat crude oils to gaseous forms in order that fractions may be taken off in the adjacent fractionation column (for example both diesel and petroleum are fractions). The unit, made of carbon steel, is usually rectangular and sits around 2m above the ground in a complex structural steel support frame which also provides walkway and staircase access to different levels. There is also a chimney. Temperatures may reach up to 850°C (range 200°C - 850°C). The fuel used is often the gaseous waste produced by the process being undertaken. The upper temperatures are reached by use of a convection box. The heating chambers are usually constructed of refractory brickwork with heat resistant ceramic lined tiles. The oil is passed through pipes that lay in the firebox. In most cases the tubes can be removed and thus are not part of the structure. Cabin Heaters are usually over 400m3 but because those under may have difficulty in fulfilling the requirements of Class 4 (d) they would be rateable.
Referencing details	Rectangular heaters: measure the main unit externally but do not include the void area below the heater in the volume, note the age, note structural steel support details under and around the heater as well as stairways and walkways, note diameter and height of the chimney. Determine whether tubes can be removed (in the absence of definitive information assume they can be)
Cost information notes	Includes refractory linings. Add separately for i) foundations, ii) supporting steelwork, iii) chimney stack, iv) walkways and v) stairways
rateable element	Class 4 Table 4 furnaces - stoves and ovens See Class 4(d)
non rateable element	if Class 4 (d) applies - tubes
Adjusted Plant and Machinery	Foundations, pits, walkways, ducts, stairways and supporting steelwork
Number of items adjusted	The item can typically be found on an industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Descriptive	Continuous Dryer
Tech1	2796m3 Gross External Volume
Tech2	-
Unit size	m3
Unit of measurement	m3
ERC	£906
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Drying units or driers work in concert with kilns. These are drying units which are needed to condition the green bricks before firing. Frequently found adjacent to the kilns in order that they can make use of the waste heat therefrom. The most common construction found is concrete blocks off a reinforced concrete foundation incorporating a rail track on which cars conveying the unfired bricks to the kilns are loaded. Normally a concrete slab or insulated steel sheeting ceiling.
Referencing details	External volume of the dryer. Construction details.
Cost information notes	Cost includes flues and ducting, refractory linings, rail track set in the floor of the kiln / dryer and foundations. Ducting to the kiln is included based on the kiln being in relatively close proximity to the drier. Where they are separated by large distances then additional ducting may be included but this is a disability and should be compensated for by allowances - net effect may be neutral.
rateable element	Class 4 Table 4 Furnaces Note Class 4(d)
non rateable element	-
Adjusted Plant and Machinery	Other Class 4 items of plant for consideration as being rateable will include:- Rail tracks and transfer ways for kiln cars Weighbridge pits
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Heat Treatment Continuous Furnaces use heat to change the molecular composition of the metal. This treatment softens the metal and then it is cooled which hardens it again, this is controlled and adjusted depending on the desired end product. For the heating, temperatures can range between extremes of 420°C and 1800°C. The hot air is re-circulated within the furnace and the lining allows for consistent heat retention. The unit is usually long and has a pre heat zone, a controlled zone and a cooling zone. There is a continuous moving bed and the insulation is either refractory tiles or quilt. The unit often sits on a support frame (which is not part of the furnace). Although the zones may be capable of being individually replaced or moved around because much of the refractory lining once fired to glaze over forms a single unit if the furnace were moved the lining would crack and require replacement, so although the furnace can be readily moved it is unusual for this to be undertaken in its original state, therefore Class 4 (d) applies

Description	Hot Stoves look like a huge cigar case with a domed top and have a refractory lining. The stoves provide the hot blast air to Furnaces. The hot blast air is produced by passing cold blast air through the preheated 'stoves' and these heat the air to above 1000°C. Essentially, the stove is a vertical cylindrical steel shell lined with firebrick with the interior separated into two chambers: a combustion chamber, in which gases from the blast furnace and from other fuel sources such as the coking plant are burned, and a regenerative chamber filled with a checker work of refractory brick heated by the burned gas. The stove itself is heated by burning gas and combustion air within the chamber and the heat is then absorbed into the brickwork. This mode is called on-gas. When sufficient heat has been absorbed, the stove is put on-blast mode. At this point no combustion takes place but cold blast air is forced through the stove and absorbs the heat to become hot blast. This is then mixed with cold blast to bring it to the right temperature, and is then forced under pressure into the blast furnace (which causes the temperature to rise further). It is forced through pipes known as tyres and these are situated near its base. It is quite common to have three or four stoves, so that at any time one stove is on-blast while the others are on-gas or boxed. A boxed stove has been heated up to temperature and sealed, so that it is ready to go on-blast. If one stove is down for repair, it is possible to run on just two stoves instead

Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tunnel kilns. In a tunnel kiln or continuous kiln the dried un-fired bricks are passed through the kiln for firing in a continuous cycle on a kiln car set on tracks. The kiln takes the form of a long brick or metal tunnel on a reinforced foundation, incorporating a rail track on which the cars conveying the ware are propelled through the tunnel. The cars first pass through a pre-heating area, then through a firing zone, and are gradually cooled before emerging at the far end. Loaded cars awaiting entry to the kilns are run onto tracks parallel to it and are conveyed to the entry point on transfer plates. The same system being employed at the exit from the kiln where the bricks are left to await unstacking. Kilns are fuelled by either gas, oil, or electricity. In some cases within the firing zone bricks are exposed to an open flame; whereas in others the flame is muffled by a special heat conducting wall. Kilns are thus referred to as open flame or muffled flame. Operating temperatures depend on the bricks being produced but a typical a modern Lingl type kiln can reach temperatures of 1060°C. The whole essence of a brickworks turns on the continued efficiency of the kilns and efforts are always being made to keep the proportion of badly fired product down to a minimum. Therefore care is usually taken to keep the kiln at peak efficiency at all times by periodic renewal and repair. Properly maintained, the life of a kiln is considerable.
Referencing details	External volume of the kiln. Construction details.
Cost information notes	Cost includes flues and ducting, refractory linings, rail track set in the floor of the kiln / dryer and foundations. Ducting to the kiln is included based on the kiln being in relatively close proximity to the drier. Where they are separated by large distances then additional ducting may be included but this is a disability and should be compensated for by allowances - net effect may be neutral.

rateable element	Class 4 Table 4 Furnaces Note Class 4(d)
non rateable element	if Class 4 (d) applies
Adjusted Plant and Machinery	Foundations, pits, walkways and ducts
Number of items adjusted	The item can typically be found on an industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Tech2	-
Unit size	m3
Unit of measurement	m3
ERC	£4,963
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	The process of pre-heating is to enable the whole item to be raised from cold up to white hot (1350°C) more quickly than in other type of furnace so that when it is introduced to a soaking pit it does not cause a major temperature drop. Billets (say 50cm x 50cm x 2m) are normally produced in this process The hot air is re-circulated within the furnace and it is lined with heavy refractory bricks to allow consistent heat retention. It is important to note that refractories, once fired, glaze over to form a single unit so that if the furnace was moved the lining would be compromised and require replacement. The brickwork is usually built up from a solid concrete base so it cannot be moved from one site and re erected in its original state on another (Class 4(d)). Consequently most sizes will be rateable. This type of furnace may have been erected on top of a steel plate that sits on a concrete foundation. If this is so the likelihood is that the furnace can be moved so if it is 400m3 or less then it would not be rateable

Description	This type of furnace heats blooms (ingots of steel) or part formed steel items that are taken in cold and heated in batches usually to a white heat (up to 1150°C) so that they can be worked (e.g. by rolling, squeezing, or drawing). This process either finishes the article or creates a product that is finished when cold (usually achieved by quenching in oil or water). This furnace usually has a single door that lifts upwards to allow full access to the furnace chamber. The process of re-heating is regulated to maintain the metal at a constant temperature to ensure that the product is cooked all the way through. Hot air is re-circulated within the furnace and it is lined with heavy refractory bricks to allow consistent heat retention, however, in other types ceramic tiles are used that when fired glaze over to form a solid lining but if the furnace were moved it would crack and require replacement. In older designs the brickwork is usually built up from a solid concrete base so the furnace cannot be moved from one site and re erected in its original state on another (Class 4(d)) and consequently most sizes will be rateable. In newer designs the furnace is erected on a steel plate that sits on a concrete foundation above the shop floor, these can be moved so if it is 400m3 or less it would not be rateable.

CG Code	209I05
Specific	Upshot Heaters
Descriptive	over 500m3
Tech1	-
Tech2	-
Unit size	m3
Unit of measurement	m3
ERC	£3,472
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Upshot Heaters are used in the chemical and petro-chemical industry to heat crude oils to gaseous forms in order that fractions (e.g. diesel petrol) may be taken off in the adjacent fractionation column. The unit includes a chimney and temperatures may reach up to 850°C. The fuel used is often the gaseous waste products from the process being undertaken. The heating chambers are usually heat resistant ceramic lined. The oil is passed through pipes that are laid in the firebox. The upshot heaters are usually cylindrical and made of carbon steel. They are usually over 400m3 but those under 400m3 may be difficult to fulfil the requirements of Class 4 (d) and thus would be rateable.
Referencing details	Rectangular heaters can also be found :- measure externally the main unit but do not include the void area below the heater. Note diameter and height of the chimney. Note structural steel support details under the heater
Cost information notes	Includes refractory linings, chimneystack. Add separately for foundations and supporting base steelwork. Note that because the cost information provided is in bands a breakpoint volume is provided for use when interpolating the cost so if the volume is above the breakpoint within the band then interpolate rate between the cost of this band and the next size up
rateable element	Class 4 Table 4 stoves and ovens See Class 4(d)
non rateable element	If Class 4(d) applies
Adjusted Plant and Machinery	Foundations, pits, walkways and ducts
Number of items adjusted	The item can typically be found on an industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Referencing details	Rectangular heaters can also be found :- measure externally the main unit but do not include the void area below the heater. Note diameter and height of the chimney. Note structural steel support details under the heater
Cost information notes	Includes refractory linings, chimneystack. Add separately for foundations and supporting base steelwork. Note that because the cost information provided is in bands a breakpoint volume is provided for use when interpolating the cost so if the volume is above the breakpoint within the band then interpolate rate between the cost of this band and the next size up
rateable element	Class 4 Table 4 stoves and ovens See Class 4(d)
non rateable element	If Class 4(d) applies
Adjusted Plant and Machinery	Foundations, pits, walkways and ducts
Number of items adjusted	The item can typically be found on an industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Tech2	-
Unit size	m3
Unit of measurement	m3
ERC	£3,522
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Upshot Heaters are used in the chemical and petro-chemical industry to heat crude oils to gaseous forms in order that fractions (e.g. diesel petrol) may be taken off in the adjacent fractionation column. The unit includes a chimney and temperatures may reach up to 850°C. The fuel used is often the gaseous waste products from the process being undertaken. The heating chambers are usually heat resistant ceramic lined. The oil is passed through pipes that are laid in the firebox. The upshot heaters are usually cylindrical and made of carbon steel. They are usually over 400m3 but those under 400m3 may be difficult to fulfil the requirements of Class 4 (d) and thus would be rateable.
Referencing details	Rectangular heaters can also be found :- measure externally the main unit but do not include the void area below the heater. Note diameter and height of the chimney. Note structural steel support details under the heater
Cost information notes	Includes refractory linings, chimneystack. Add separately for foundations and supporting base steelwork. Note that because the cost information provided is in bands a breakpoint volume is provided for use when interpolating the cost so if the volume is above the breakpoint within the band then interpolate rate between the cost of this band and the next size up

Generic Category	Gas cleaning
CG Code	210A01
Specific	Bag filters
Descriptive	Heavy duty - 10 compartments - 200 bags each
Tech1	Filter house 5,400m³
Tech2	Inc hoppers and steel support
Unit size	-
Unit of measurement	m3
ERC	£296
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Bag Filters - In operation this item of plant resembles a vacuum cleaner as dirty air is taken through material filters to remove fine particles of dust. Large versions of this item can be found in Steelworks, Cement works or Mineral extraction locations but smaller versions are now found in numerous industries where dirty air requires the removing of particles. In many cases, where specific machinery produces a very dirty air, a hood is installed over the machine to specifically remove the polluted air. In other cases a hood in the roof of the building takes the dirty air from the building. The Bag filter fans produces a negative pressure in the hood and the dirty air is sucked via ducts to the main plant. The air is then sucked upwards through fine nylon bags and released to the atmosphere. For an electric arc furnace of 100 tonnes there would be some 2000 bags. The bags are situated in sections and they can be isolated and shaken and a reversed pressure can be introduced enabling the dust to fall to the bottom of the bag into a hopper. From here the dust is placed into bags via a conveyor system. The Bag Filter is usually situated on a steel support frame, there are steel hoppers under the bags and the whole plant sits on a concrete base.
Referencing details	Calculate external cubic volume of the item - note details of supports and foundations (to be costed separately).
Cost information notes	The Class 4 Table 4 rateable element (structural parts only) amount to 48% of the total cost.
rateable element	In Class 1 = the entirety of the item. In Class 2 = unlikely to be rateable. In Class 3 = not rateable. In Class 4 = rateable to the extent of structural parts, if cubic capacity measured externally is 400 cubic metres or more, or if the item is not readily capable of being re-erected elsewhere per the Class 4 (d) proviso.
non rateable element	-
Adjusted Plant and Machinery	Ducts, flues, settings , supports, foundations, walkways and platforms.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	-
Photo description	Photo 1 - Heavy duty. Photo 2 - Lighter duty bag filter. Photo 3 - Lighter duty bag filter (may be below 400m³)
Photo notes	Photo 2 - Most systems have two main chambers for full reverse flow. Note: This is a single unit that operates as one. It is the total volume that is required of both parts of the bag filter in order to determine its overall size.

Description	Bag Filters - In operation this item of plant resembles a vacuum cleaner as dirty air is taken through material filters to remove fine particles of dust. Large versions of this item can be found in Steelworks, Cement works or Mineral extraction locations but smaller versions are now found in numerous industries where dirty air requires the removing of particles. In many cases, where specific machinery produces a very dirty air, a hood is installed over the machine to specifically remove the polluted air. In other cases a hood in the roof of the building takes the dirty air from the building. The Bag filter fans produces a negative pressure in the hood and the dirty air is sucked via ducts to the main plant. The air is then sucked upwards through fine nylon bags and released to the atmosphere. For an electric arc furnace of 100 tonnes there would be some 2000 bags. The bags are situated in sections and they can be isolated and shaken and a reversed pressure can be introduced enabling the dust to fall to the bottom of the bag into a hopper. From here the dust is placed into bags via a conveyor system. The Bag Filter is usually situated on a steel support frame, there are steel hoppers under the bags and the whole plant sits on a concrete base.
Referencing details	Calculate external cubic volume of the item - note details of supports and foundations (to be costed separately).
Cost information notes	The Class 4 Table 4 rateable element (structural parts only) amount to 48% of the total cost.
rateable element	In Class 1 = the entirety of the item. In Class 2 = unlikely to be rateable. In Class 3 = not rateable. In Class 4 = rateable to the extent of structural parts, if cubic capacity measured externally is 400 cubic metres or more, or if the item is not readily capable of being re-erected elsewhere per the Class 4 (d) proviso.
non rateable element	-

Cost information notes	The main considerations are the volume of gas being cleaned, its temperature and its chemical composition.
rateable element	In Class 1 = the entirety of the item. In Class 2 = unlikely to be rateable. In Class 3 = not rateable. In Class 4 = rateable to the extent of structural parts, if cubic capacity measured externally is 400 cubic metres or more, or if the item is not readily capable of being re-erected elsewhere per the Class 4 (d) proviso.
non rateable element	-
Adjusted Plant and Machinery	Ducts, flues, walkways
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Ducts are found in industrial premises where large quantities of gases (often hot) require to be taken from the point of combustion to some form of gas cleaning equipment. i.e. Bag filter plant, electrostatic precipitator, or cyclone. Industries usually having gas-cleaning facilities include steelworks and cement works. Smaller operations also have ducting either near engines or to transport products round the property. There are two basic types: (1) Square / rectangular section (2) Tube. The duct is usually welded (bolted and sealed) as often an induced draught fan is employed to form a negative pressure, which draws the fumes (product) towards it and through the cleaning equipment. Where the fumes are very hot or abrasive the initial section of the ducts is refractory lined. The duct from the cleaning equipment to the chimney is not usually lined. Ducts gain support from factory buildings and machines but often have trestle supports or steel racks on which they rest especially if they are at high level and cover a long distance when elevated. Cost does not include any supports.
Referencing details	External dimensions of duct and length of duct.
Cost information notes	-
rateable element	Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the 'structure' test.
non rateable element	Pipes and ducts under 300 mm diameter
Adjusted Plant and Machinery	-
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Variations	If the ducting system has size changes (size reduction / increase) then add 35% to the cost.

Back

Generic Category	Gas cleaning
CG Code	217A28
Specific	Ducting
Descriptive	Square or Rectangular
Tech1	Insulated ducting, with heat / fire resistant liner, aalso cladded.
Tech2	If steel construction then reference DW144 ductwork classification (giving thickness, materials, installation guidance) or similar standard.
Unit size	Duct surface area
Unit of measurement	m2
ERC	£236
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Ductwork for ventilation or warm gas extraction. Ducts gain support from factory/office buildings and machines but often have trestle supports or steel racks on which they rest especially if they are at high level and cover a long distance when elevated. Cost does not include any supports.
Referencing details	External dimensions of duct, length of duct, if the duct insulated or lined/fire rated
Cost information notes	The ERC is calculated on the basis of the total surface area of ducting in m2.
rateable element	Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the 'structure' test.
non rateable element	Pipes and ducts under 300 mm diameter
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Generic Category	Gas cleaning
CG Code	210F60
Specific	Ducting
Descriptive	Square section, low temperature
Tech1	6mm thick steel
Tech2	1.0m x 1.0m square
Unit size	Linear metre
Unit of measurement	m
ERC	£577
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Ducts are found in industrial premises where large quantities of gases (often hot) require to be taken from the point of combustion to some form of gas cleaning equipment. i.e. Bag filter plant, electrostatic precipitator, or cyclone. Industries usually having gas-cleaning facilities include steelworks and cement works. Smaller operations also have ducting either near engines or to transport products round the property. There are two basic types: (1) Square / rectangular section (2) Tube. The duct is usually welded (bolted and sealed) as often an induced draught fan is employed to form a negative pressure, which draws the fumes (product) towards it and through the cleaning equipment. Where the fumes are very hot or abrasive the initial section of the ducts is refractory lined. The duct from the cleaning equipment to the chimney is not usually lined. Ducts gain support from factory buildings and machines but often have trestle supports or steel racks on which they rest especially if they are at high level and cover a long distance when elevated. Cost does not include any supports.
Referencing details	External dimensions of duct and length of duct. (width x height x length)
Cost information notes	-
rateable element	Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the 'structure' test.

Generic Category	Gas cleaning
CG Code	210F11
Specific	Ducting - circular
Descriptive	Circular Ducts - Insulation
Tech1	Addition for 50mm external insulation
Tech2	2.0m dia
Unit size	-
Unit of measurement	m
ERC	£425
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	The cost represents an addition to the basic duct price to reflect the addition of 50mm of insulation to the external surface of the duct giving a polybutylene finish. Cost is £ per linear metre of duct
Referencing details	Width and height or diameter and length.
Cost information notes	-
rateable element	Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the 'structure' test.
non rateable element	Pipes and ducts under 300 mm diameter
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	-

Generic Category	Gas cleaning
CG Code	210F30
Specific	Ducts - Circular or Square Section
Descriptive	Heavy duty applications - Cement works
Tech1	0.75m square section
Tech2	Welded and flanged with bolted connections
Unit size	Linear metre
Unit of measurement	m
ERC	£923
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Ducts are found in industrial premises where large quantities of gases (often hot) require to be taken from the point of combustion to some form of gas cleaning equipment. i.e. Bag filter plant, electrostatic precipitator, or cyclone. Industries usually having gas-cleaning facilities include steelworks and cement works. Smaller operations also have ducting either near engines or to transport products round the property. There are two basic types: (1) Square / rectangular section (2) Tube. The duct is usually welded (bolted and sealed) as often an induced draught fan is employed to form a negative pressure, which draws the fumes (product) towards it and through the cleaning equipment. Where the fumes are very hot or abrasive the initial section of the ducts is refractory lined. The duct from the cleaning equipment to the chimney is not usually lined. Ducts gain support from factory buildings and machines but often have trestle supports or steel racks on which they rest especially if they are at high level and cover a long distance when elevated. Cost does not include any supports.
Referencing details	External dimensions of duct and length of duct. (width x height x length)
Cost information notes	-

Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Gatehouse weighbridge building
CG Code	425005
Specific	Single Storey
Descriptive	Less than 10m2
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£1,213
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The building is assumed to be single storey of traditional form of construction, brick cladding and varying heights. An average size is adopted based on the size ranges given with an assumed rectangular floor plate. All buildings are assumed to have a pitched roof profile with lighting and power only allowed as Mechanical & Electrical services.
Referencing details	Measure to GEA
Cost information notes	For glass reinforced plastic see Portable Buildings. Often houses CCTV equipment and monitors- for costs see Security and Alarm Systems
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Hoists
CG Code	211C01
Specific	Chain Block
Descriptive	Electric ; Single speed 3m lift height
Tech1	0.5 tonne
Tech2	500kg
Unit size	-
Unit of measurement	Each
ERC	£2,563
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Electric powered lifting device for loads that are too heavy for manual handling. Usually hooked under a suitable beam, jib or davit able to support the load, with single speed travel.
Referencing details	Record maximum lifting weight (Safe Working Load - SWL) and lifting height. Note support structure.
Cost information notes	-
rateable element	Hoist rateable under Class 2(b) and supports under Class 4 Table 3.
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit size	-
Unit of measurement	Each
ERC	£9,711
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Hoists come in several formations and generally they are regarded as the mechanical part of lifting apparatus. An engine with a drum used for winding up a load, tackle for raising goods. For over-head hoists, where they operate within twin support beams, which move up and down a shop floor, the whole unit is more correctly described as a moving traveller and should be rated accordingly. Where, however, the engine and drum move along a simple beam, this can be correctly described as a hoist. Hoist lifting platforms within cages (shafts) i.e. Dumb Waiters and goods part lifts are lightweight forms of lifts. Goods/Passenger hoists with wire cages are usually found in industrial premises. The Electric wire rope hoist has a heavy duty wire rope wound onto a drum and attached to a hook, powered by an electric motor to raise and lower objects.
Referencing details	Speeds across the main beam and lifting speeds may be single or multiple. The lifting attachment may be chain or wire rope. NOTE: weight limit and height of lift.
Cost information notes	The motor and cable drum plus the manual controls have been included in the cost
rateable element	A hoist is rateable under Class 3(b). There are no limitations on size; whether the item is a structure or what can be included. It is assumed that the supporting beam is additional to the cost of the hoist and should be rated under Class 4 Table 3 supports.

Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Hoists
CG Code	211C35
Specific	Wire rope
Descriptive	Hoist speed 5.5m per minute
Tech1	Lift height 5.5m
Tech2	Max lifting weight 7.5 tonne
Unit size	-
Unit of measurement	Each
ERC	£17,531
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Hoists come in several formations and generally they are regarded as the mechanical part of lifting apparatus. An engine with a drum used for winding up a load, tackle for raising goods. For over-head hoists, where they operate within twin support beams, which move up and down a shop floor, the whole unit is more correctly described as a moving traveller and should be rated accordingly. Where, however, the engine and drum move along a simple beam, this can be correctly described as a hoist. Hoist lifting platforms within cages (shafts) i.e. Dumb Waiters and goods part lifts are lightweight forms of lifts. Goods/Passenger hoists with wire cages are usually found in industrial premises. The Electric wire rope hoist has a heavy duty wire rope wound onto a drum and attached to a hook, powered by an electric motor to raise and lower objects.
Referencing details	Speeds across the main beam and lifting speeds may be single or multiple. The lifting attachment may be chain or wire rope. NOTE: weight limit and height of lift.
Cost information notes	The motor and cable drum plus the manual controls have been included in the cost
rateable element	A hoist is rateable under Class 3(b). There are no limitations on size; whether the item is a structure or what can be included. It is assumed that the supporting beam is additional to the cost of the hoist and should be rated under Class 4 Table 3 supports.
non rateable element	-

Description	There is no official definition within the NHS of an Acute Hospital. Typically a hospital coming within this description provides a wide range of specialist care and treatment for patients that may include routine, complex and life saving surgery and specialist diagnostic procedures and treatment. Although some consultations and treatments may be undertaken on an outpatient basis, an Acute Hospital will usually have a significant inpatient resource for observation, treatment and recovery. Acute Hospitals may also be teaching or university hospitals reflecting the opportunities they afford to provide medical training in general and specialist areas. The distinguishing features of these hospitals usually include: •major operating theatres, full A&E, ICU & HDU facilities. •of significant importance within the Trust. •substantial general wards.

Description	Community Hospitals are small local hospitals that provide a range of services to their local community. Community hospitals vary considerably, having been originally established as converted cottages offering inpatient beds, they have developed into hubs offering services including community beds, maternity, clinics, minor injuries units, X-ray departments, health promotion, diagnostics, treatments, rehabilitation and end of life care.

Description	Typically a hospital coming within this description provides a wide range of specialist care and treatment for patients that may include routine, complex and life saving surgery and specialist diagnostic procedures and treatment. Although some consultations and treatments may be undertaken on an outpatient basis, an Acute Hospital will usually have a significant inpatient resource for observation, treatment and recovery. The distinguishing features of these hospitals usually include: •Major operating theatres, ICU & HDU facilities. •Substantial general wards.

Description	A private hospital is a hospital owned and operated by an organisation other than the state, whether for-profit or a non-profit, and privately funded through payment for medical services by patients themselves, by insurers, governments through national health insurance programs, or by foreign embassies. The term is mainly used in the United Kingdom where private hospitals are distinguished from NHS institutions.

Generic Category	Hydraulic pumps
CG Code	212P102
Specific	Pump set
Descriptive	110kW
Tech1	kW rating of main motor
Tech2	-
Unit size	Per Kw
Unit of measurement	kW
ERC	£944
Superseded codes	212P28
Location factor	Considered Not Applicable at time of Publication
Description	A typical hydraulic pump set sits on a skid and has a reservoir for hydraulic fluid, there are usually 3 motor / pump units each one capable of producing the power required. The set will have manifolds and valves and is generally positioned near the machinery using the hydraulic power. The maximum pressure for this type of set would be 350 bar, although typically 145 to 250 bar is more commonly found as normal working pressure. The guide cost represents a set with 3 main motors and these may either be used individually or run together. A set can have 2 smaller motor pumps for circulating coolant through the reservoir and assist in circulating the pressurised hydraulic fluid through the system. The pipes on the skid, electrical controls, computer equipment along with a nominal amount for any accumulators and any pipework connecting the set to the hydraulically operated plant.
Referencing details	Cost is for a set and include an accumulator and pipework to the hydraulically operated machinery. Cost includes additions for delivery, installation and commissioning.. Costs nominally include two smaller motor / pumps which are for circulating the coolant and drawing back the hydraulic fluid into the main reservoir. Motors are 415 v 50Hz @ nominal 1,450 rpm, pressures up to 350 bar
Cost information notes	The cost is per kW of motor power and the power of the largest main motor should be recorded. It is not necessary to add together the kW of any additional motors.
rateable element	Main Transmission of Power Class 1 Table 1(h) Pumping engines for hydraulic power List of Accessories (viii) instrumentation. Hydraulics used for Power purposes - Class 1 Table 1(h) Class 1 Table 1(l) List of Accessories 2 (i) to (viii)
non rateable element	-
Adjusted Plant and Machinery	Foundations, Settings, Pits. Pipes - main supply pipes The transmission of power through the pipes is an essential part of the operation being undertaken and the pipes are specifically constructed to minimise power loss through their length. They are required to be flexible enough to prevent joints, yet be capable of maintaining the pressure required. The end couplings have to be sealed to the pipe and be of specific specification to be capable of withholding pressure.

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Motors are 415 v 50Hz @ nominal 1,450 rpm, pressures up to 350 bar
Cost information notes	The cost is per kW of motor power and the power of the largest main motor should be recorded. It is not necessary to add together the kW of any additional motors.
rateable element	Main Transmission of Power Class 1 Table 1(h) Pumping engines for hydraulic power List of Accessories (viii) instrumentation. Hydraulics used for Power purposes - Class 1 Table 1(h) Class 1 Table 1(l) List of Accessories 2 (i) to (viii).
non rateable element	-
Adjusted Plant and Machinery	Foundations, Settings, Pits. Pipes - main supply pipes The transmission of power through the pipes is an essential part of the operation being undertaken and the pipes are specifically constructed to minimise power loss through their length. They are required to be flexible enough to prevent joints, yet be capable of maintaining the pressure required. The end couplings have to be sealed to the pipe and be of specific specification to be capable of withholding pressure.

Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Hydraulic pumps
CG Code	212P98
Specific	Pump set
Descriptive	45kW
Tech1	kW rating of main motor
Tech2	-
Unit size	Per Kw
Unit of measurement	kW
ERC	£1,590
Superseded codes	212P24
Location factor	Considered Not Applicable at time of Publication
Description	A typical hydraulic pump set sits on a skid and has a reservoir for hydraulic fluid, there are usually 3 motor / pump units each one capable of producing the power required. The set will have manifolds and valves and is generally positioned near the machinery using the hydraulic power. The maximum pressure for this type of set would be 350 bar, although typically 145 to 250 bar is more commonly found as normal working pressure. The guide cost represents a set with 3 main motors and these may either be used individually or run together. A set can have 2 smaller motor pumps for circulating coolant through the reservoir and assist in circulating the pressurised hydraulic fluid through the system. The pipes on the skid, electrical controls, computer equipment along with a nominal amount for any accumulators and any pipework connecting the set to the hydraulically operated plant.
Referencing details	Cost is for a set and include an accumulator and pipework to the hydraulically operated machinery. Cost includes additions for delivery, installation and commissioning.. Costs nominally include two smaller motor / pumps which are for circulating the coolant and drawing back the hydraulic fluid into the main reservoir. Motors are 415 v 50Hz @ nominal 1,450 rpm, pressures up to 350 bar
Cost information notes	The cost is per kW of motor power and the power of the largest main motor should be recorded. It is not necessary to add together the kW of any additional motors.

The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an additionusing code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41RR4Q
Specific	Uninsulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	501 - 1,000m2
Tech2	Eaves Height - 44m
Unit size	-
Unit of measurement	m2
ERC	£1,045
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with no insulation, on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal uninsulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power ; EXCLUDES heating ; Underslab storm drainage from internal downpipes on building area greater than 1,000m2
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	101 - 250m2
Tech2	Eaves Height - 20m
Unit size	-
Unit of measurement	m2
ERC	£1,334
Superseded codes	41P397
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Superseded codes	41P81T, 41P421
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Superseded codes	41P83T, 41P447
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Superseded codes	41P87T, 41P471
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	42A01Y
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	10,001 - 20,000m2
Tech2	Eaves Height - 18m
Unit size	-
Unit of measurement	m2
ERC	£583
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	42A03Q
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	over 20,000m2
Tech2	Eaves Height - 18m
Unit size	-
Unit of measurement	m2
ERC	£530
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. ERC	£1,955
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P730
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	251 - 500m2
Tech2	Eaves Height - 21m
Unit size	-
Unit of measurement	m2
ERC	£1,009
Superseded codes	41P81V, 41P423
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P740
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	251 - 500m2
Tech2	Eaves Height - 31m
Unit size	-
Unit of measurement	m2
ERC	£1,201
Superseded codes	41P88F, 41P433
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P761
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	501 - 1,000m2
Tech2	Eaves Height - 27m
Unit size	-
Unit of measurement	m2
ERC	£903
Superseded codes	41P93B, 41P455
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P782
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	5,001 - 10,000m2
Tech2	Eaves Height - 23m
Unit size	-
Unit of measurement	m2
ERC	£718
Superseded codes	41P87X, 41P475
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P792
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	5,001 - 10,000m2
Tech2	Eaves Height - 33m
Unit size	-
Unit of measurement	m2
ERC	£769
Superseded codes	41P97H, 41P485
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Industrial Buildings
CG Code	41P95D
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	1,001 - 5,000m2
Tech2	Eaves Height - 29m
Unit size	-
Unit of measurement	m2
ERC	£767
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P70F
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	101 - 250m2
Tech2	Eaves Height - 5m
Unit size	-
Unit of measurement	m2
ERC	£865
Superseded codes	41P32I
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P71K
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	101 - 250m2
Tech2	Eaves Height - 10m
Unit size	-
Unit of measurement	m2
ERC	£1,021
Superseded codes	41P33K
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P72M
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	251 - 500m2
Tech2	Eaves Height - 7.5m
Unit size	-
Unit of measurement	m2
ERC	£710
Superseded codes	41R22M, 41P80M, 41P34T
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P74F
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	501 - 1,000m2
Tech2	Eaves Height - 5m
Unit size	-
Unit of measurement	m2
ERC	£580
Superseded codes	41P82F, 41R24F, 41P36I
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P75K
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	501 - 1,000m2
Tech2	Eaves Height - 10m
Unit size	-
Unit of measurement	m2
ERC	£645
Superseded codes	41P82Y, 41R24Y, 41P37K
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P76M
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	5,001 - 10,000m2
Tech2	Eaves Height - 7.5m
Unit size	-
Unit of measurement	m2
ERC	£594
Superseded codes	41R28M, 41P86M, 41P38T
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41PAA5
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	0 - 100m2
Tech2	Eaves Height - 5m
Unit size	-
Unit of measurement	m2
ERC	£1,009
Superseded codes	41P30I
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41PAB6
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	0 - 100m2
Tech2	Eaves Height - 10m
Unit size	-
Unit of measurement	m2
ERC	£1,207
Superseded codes	41P31K
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	1,001 - 5,000m2
Tech2	Eaves Height - 7.5m
Unit size	-
Unit of measurement	m2
ERC	£573
Superseded codes	41P84M
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P88QA
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	251 - 500m2
Tech2	Eaves Height - 40m
Unit size	-
Unit of measurement	m2
ERC	£1,374
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	41P93R
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	501 - 1,000m2
Tech2	Eaves Height - 41m
Unit size	-
Unit of measurement	m2
ERC	£1,084
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. Tech1	1,001 - 5,000m2
Tech2	Eaves Height - 42m
Unit size	-
Unit of measurement	m2
ERC	£860
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	42A19M
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	101 - 250m2
Tech2	Eaves Height - 43m
Unit size	-
Unit of measurement	m2
ERC	£2,092
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	42A19X
Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	10,001 - 20,000m2
Tech2	Eaves Height - 43m
Unit size	-
Unit of measurement	m2
ERC	£708
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Specific	Insulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	over 20,000m2
Tech2	Eaves Height - 43m
Unit size	-
Unit of measurement	m2
ERC	£630
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W
