Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with no insulation, on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal uninsulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power ; EXCLUDES heating ; Underslab storm drainage from internal downpipes on building area greater than 1,000m2
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an additionusing code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Industrial Buildings
CG Code	42A21H
Specific	Uninsulated Buildings
Descriptive	Sheet Metal Cladding
Tech1	10,001 - 20,000m2
Tech2	Eaves Height - 37m
Unit size	-
Unit of measurement	m2
ERC	£638
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with no insulation, on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal uninsulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power ; EXCLUDES heating ; Underslab storm drainage from internal downpipes on building area greater than 1,000m2
Referencing details	-
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Jetties Maritime and Waterways
CG Code	51Z001A
Specific	Berthing Heads
Descriptive	Up to 50,000 DWT (deadweight tonnes)
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£4,447
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Berthing heads are jetty structures that vessels berth against ('berth' means the ship is tied up to the jetty/dock for a period of time) and may incorporate strongpoints with berthing and mooring structures located at these. They are typically located in deeper water.
Referencing details	The plan area (m2) and loading capacity are key survey requirements. The plan area should be recorded to include the berthing head and any adjoining piperack. These areas should be recorded separately (i.e. berthing head 1000m2, piperack 1000m2). The loading capacity should be recorded in deadweight tonnes (DWT). Details including surfacing and the type of structure (steel, concrete, timber) should also be noted.
Cost information notes	This cost should be applied to all berthing heads on "T" shaped jetties. Costs required for ships in the size range from 10,000 DWT - 300,000 DWT, Ships of less than 10,000 DWT generally do not require berthing dolphins as ships of this size are, usually moored against "fenders" on the berthing head. The cost quoted reflects an addition of 35% for risk bias. No adjustments for contract size, fees and location are appropriate. Risk bias factors include; security restrictions, the method of working out over water, water depth, tidal range, environmental conditions, environmental designation, operational limitations and ground conditions. The level of any such addition should be reviewed taking into consideration the overall parameters on risk bias, as set out in Rating Manual: Section 5a : Valuation of all property types: Jetties Maritime and Waterways and the individual facts relating to the asset. For the purposes of indexation, the cost should be adjusted by reference to the BCIS General Civil Engineering Cost Index, Series 1191.

Descriptive	Pontoon
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£4,371
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Pontoons are flotation devices or floating structures used to create platforms, floating docks, boat hulls, bridges, work platforms, and floating homes. They are more heavily engineered than the pontoons typically found in marina environments and are normally a concrete structure which is attached to dolphins (piles) which permit the pontoon to move vertically to accommodate changes in water level whether within a dock or due to tidal changes. The dolphins will typically be smaller than those referenced elsewhere in this document and are used simply to anchor a pontoon in place. Both the pontoon and the bridge are measured by reference to the surface area of the structure: length x width. Pontoons are floating platforms capable of accommodating the berthing of off-shore vessels and linked to the adjacent land/wharf by a bridge. They are more heavily engineered than the pontoons typically found in marina environments and are normally a concrete structure which is attached to dolphins (piles), anchors and other forms of attachment which permit the pontoon to move vertically to accommodate changes in water level whether within a dock or due to tidal changes.
Referencing details	The surface area of the structure (m2), length x width.
Cost information notes	The cost quoted here reflects ideal conditions and has not been adjusted for any site specific risks, please refer to the Jetties and Maritime Structures Practice Note for guidance on adjustments to be made. No adjustments for contract size, fees and location are appropriate.

Unit size	-
Unit of measurement	Each
ERC	£842,480
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A ship access tower is typically a complicated structure, which includes a mechanically operated gangway that can be moved to suit the deck heights of all berthed vessels across all tidal levels. Often with caged ladders, stairs and platforms. The ships gangway is often operated by hydraulic controls.
Referencing details	The number and type of tower is required. General supporting steelwork should be measured by reference to weight (tonnes).
Cost information notes	The cost quoted here reflects ideal conditions and has not been adjusted for any site specific risks, please refer to the Jetties and Maritime Structures Practice Note for guidance on adjustments to be made. No adjustments for contract size, fees and location are appropriate.

Specific	Walkways / Catwalks
Descriptive	Based on catwalk/walkway of 1.22m width,
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m
ERC	£3,484
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A catwalk/walkway is a pedestrian bridge providing operational or maintenance access to offshore dolphins. Loading is typically low as the walkway capacity is limited by the width of the walkway. The structures are typically fabricated offsite using steel or aluminium sections and delivered as completed items.
Referencing details	Linear metre run (m). Details of construction should also be noted. i.e. steel/timber, open tread, handrails etc.
Cost information notes	The cost quoted here reflects ideal conditions and has not been adjusted for any site specific risks, please refer to the Jetties and Maritime Structures Practice Note for guidance on adjustments to be made. No adjustments for contract size, fees and location are appropriate.

Generic Category	Jetties Maritime and Waterways
CG Code	51Z019
Specific	Shore Arm & Approach Way (Access from Shore/Riverside to Berthing Heads)
Descriptive	Heavy Load
Tech1	Above 40kn/m2
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£7,183
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	These are jetty structures that provide walkways or roadways and/or piperacks from shore to boat/ship berths located in deeper water. The typical form of construction is an open structure comprising a suspended reinforced concrete deck supported by steel tubular piles, however structures in shallower water may use a closed structure using granular infill between a pair of walls with ties between. Class 1 – Pedestrian and Light Vehicle Loading /Piperack = 10kN/m2 – This Classification considers the following vehicle types for use. All Vehicles of gross weight of 17 tonnes based on a maximum axle loading of 100KN and an axle spacing of 3.5 and 5.8m. This is attributed to Fire Engines, and light goods vehicles. Class 2 – Roadway > 10kn/m2 but = 40kN/m2 – All Normal Highway traffic without special assessment (Up to gross weight of 44 tonnes based on a maximum axle loading of 115KN). Class 3 – Heavy Load >40kN/m2 – Abnormal Loads
Referencing details	The plan area (m2) and loading capacity are key survey requirements. The plan area should be recorded to include the roadway and any adjoining piperack. These areas should be recorded separately (i.e. roadway 1000m2, piperack 1000m2). The loading capacity (kN/m2) and the use of the structure should be recorded i.e. is it used for pedestrian loading, for vehicles and/or for heavy loading. Details including surfacing and the type of structure (steel, concrete, timber) should also be noted.
Cost information notes	Costs required for ships in the size range from 10,000 DWT - 300,000 DWT, Ships of less than 10,000 DWT generally do not require berthing dolphins as ships of this size are, usually moored against “fenders” on the berthing head. The cost quoted reflects an addition of 35% for risk bias. No adjustments for contract size, fees and location are appropriate. Risk bias factors include; security restrictions, the method of working out over water, water depth, tidal range, environmental conditions, environmental designation, operational limitations and ground conditions. The level of any such addition should be reviewed taking into consideration the overall parameters on risk bias, as set out in Rating Manual: Section 5a : Valuation of all property types: Jetties Maritime and Waterways and the individual facts relating to the asset. For the purposes of indexation, the cost should be adjusted by reference to the BCIS General Civil Engineering Cost Index, Series 1191.

Description	Three storey building comprising laboratories with open plan write-up offices. Roof mounted plant covers most of the building footprint and services run in a dedicated service zone. Client furniture and fittings are excluded. Building Construction: Foundations - Reinforced concrete pad and perimeter foundations with 200mm thick slab. Frame - Insitu reinforced concrete frame with steel frames to roof plant rooms. Upper Floors - Flat reinforced concrete slabs 300mm thick. Roof - Stainless steel sheets. Stairs - concrete stairs with metal and glazed balustrades. External Walls - Stainless steel sheets and aluminium curtain walling. Windows and Doors - Double glazed aluminium. Internal Walls - Dry-lined full height partitions and glazed screens. Internal Doors - laminate, veneered solid core door sets. Internal Finishes - Walls generally plastered and painted; floors tiled (reception), vinyl sheet and carpet (offices); ceilings metal tiles with some plasterboard. Fittings - Laboratory modular furniture. Services - toilets, heating with cooling to labs controlled by building management system, full electrical installation including UPS, lifts, fire alarm system, intruder detection, CCTV and access controls, medical gas lines.
Referencing details	Measure to GEA Note special gases. Specialist fixed (built in) equipment egg fume cupboards, autoclaves, driers etc.
Cost information notes	Excludes external works and piling.

Generic Category	Lagoons
CG Code	208L16
Specific	Excavation only
Descriptive	Based on volume removed
Tech1	-
Tech2	-
Unit size	m3
Unit of measurement	m3
ERC	£45
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Lagoons, without clay, polythene or butyl lining. Used for overflow or balancing water flows or for temporary or permanent storage. NOTE: When calculating the surface area for linings it should be assumed that the side walls of the excavation slope at an angle not exceeding 45 degrees (measured internal surface of excavation).
Referencing details	Costs are £/m3. All calculations are from existing ground level. Excludes any banks or retaining structures above ground level. NOTE: The lagoon formation is calculated on the volume of earth removed. Where the removed spoil is used to form banks or levees around the excavation to increase the height/volume, then these will need to be a separate calculation, (see earth bunds).
Cost information notes	Excludes, sumps, pumps, chamber and channels. Excludes all External Works such as safety fencing, roads, paths or conduits which will have to be separately costed.

Descriptive	Applicable to a dry only leisure centre or the dry side accommodation only of a leisure centre with wet and dry facilities.
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£1,960
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	There are great varieties between leisure centres, some provide just dry facilities whilst other also have swimming pools. This code is for the dry side accommodation only. Generally a two storey building, commonly housing gym/fitness space, sport studios (spinning, dance and similar), sports hall, squash courts, multi-purpose rooms, climbing wall, treatment rooms, changing facilities with showers and toilets, café and ancillary storage and office space. All facilities may not be present in all buildings. Variations in design, external finishes and construction between buildings. Steel frame with external walls finished with a range of cladding materials is common. Internally the finishes comprise emulsion or ceramic tiling/uPVC sheeting to plastered walls, combination of painted plasterboard and suspended ceilings or exposed underside of roof coverings and combination of vinyl, carpet and ceramic tiling floor coverings on screed with specialist timber sports floor to sports hall, courts and studios if present. Reception desk, cubicles, lockers and benches together with seating to viewing areas, fixed sport fittings to sports hall, kitchen fittings to café and staff areas and climbing wall (if present). Services provision generally comprises heating and at least partial cooling/air conditioning, extensive sanitary, plumbing and ventilation installations to changing and toilet areas, power, lighting, lift, fire and intruder alarms, data and AV installations with possible additional security installations and sustainable features.

Generic Category	Leisure centres
CG Code	STE020
Specific	Wet side accommodation with 50m long swimming pool
Descriptive	Applicable to a wet only leisure centre with a 50m long swimming pool or the wet side accommodation with a 50m long swimming pool only of a leisure centre with wet and dry facilities.
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£3,241
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Generally a two storey building, commonly housing either a 50m long single main swimming pool or a 50m long main pool and a smaller secondary pool together with changing facilities with showers and toilets, café and ancillary storage and office space. Additional wet side facilities may also comprise saunas and spa areas. All facilities may not be present in all buildings. Variations in design, external finishes and construction between buildings. Steel frame with external walls finished with a range of cladding materials is common. Internally the finishes comprise emulsion or ceramic tiling/uPVC sheeting to plastered walls, combination of painted plasterboard and suspended ceilings or exposed underside of roof coverings and combination of vinyl, carpet and ceramic tiling floor coverings on screed. Reception desk, cubicles, lockers and benches together with seating to viewing areas, kitchen fittings to café (if present) and staff areas. Services provision generally comprises specialist pool equipment including water filtration and heating, space heating, extensive sanitary, plumbing and ventilation installations to changing and toilet areas, power, lighting, lift, fire and intruder alarms, data and Audio Visual (AV) installations with possible swimming timing system, additional security installations and sustainable features.
Referencing details	Please refer to Rating Manual Section 5a: Valuation of all property classes: Sports centres, tennis centres, swimming pools and leisure centres (local authoritiy)

Generic Category	Lifts
CG Code	211E02
Specific	Bucket Elevator
Descriptive	Heavy Duty
Tech1	Up to 20m Height
Tech2	Vertical Enclosed - Slow Speed
Unit size	Each
Unit of measurement	m
ERC	£17,560
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A continuous belt with flexible, strengthened "rubberised" buckets. These can be made from steel. Driven by a motor and complete with controls and instrumentation. The belt may be contained within support structure with sidewalls. Support structure to belt and motor is included in the cost as is a "flexible" chute to aim the product into a hopper. Construction, angle of lift, type of product, rate of delivery all can vary the cost. The cost provided is an average cost and includes design, erection, installation and on-costs etc.
Referencing details	Record the vertical height of the elevator, length and width of belt (length travelled not total belt length). If available the tonne per hour capacity. The costs relate to the length of the elevator / conveyor not the vertical lift.
Cost information notes	Total length of belt is from end to end of belt. Costs include: Belt, motors, controls, immediate support to belt and side walls, chute to hopper. Costs do not include: Main supporting frame or existing storage hoppers, stairways, housings / covers to belt.
rateable element	Class 3 (b) escalators
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Supports foundations, hoppers, stairways, walkways and platforms.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Lifts
CG Code	211E03
Specific	Bucket Elevator
Descriptive	Normal Duty
Tech1	Up to 20m Height
Tech2	Vertical Enclosed - Slow Speed
Unit size	Each
Unit of measurement	m
ERC	£13,268
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A continuous belt with flexible, strengthened "rubberised" buckets. These can be made from steel. Driven by a motor and complete with controls and instrumentation. The belt may be contained within support structure with sidewalls. Support structure to belt and motor is included in the cost as is a "flexible" chute to aim the product into a hopper. Construction, angle of lift, type of product, rate of delivery all can vary the cost. The cost provided is an average cost and includes design, erection, installation and on-costs etc.
Referencing details	Record the vertical height of the elevator, length and width of belt (length travelled not total belt length). If available the tonne per hour capacity. The costs relate to the length of the elevator / conveyor not the vertical lift.
Cost information notes	Total length of belt is from end to end of belt. Costs include: Belt, motors, controls, immediate support to belt and side walls, chute to hopper. Costs do not include: Main supporting frame or existing storage hoppers, stairways, housings / covers to belt.
rateable element	Class 3 (b) escalators
non rateable element	-
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Supports foundations, hoppers, stairways, walkways and platforms.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

CG Code	211C93
Specific	Hoist for Materials
Descriptive	Enclosed, includes shaft
Tech1	2000kg
Tech2	28.0m/min
Unit size	Each
Unit of measurement	Each
ERC	£97,876
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Rack and pinion materials hoist (complete unit including motors etc.). Comprising base frame and ground enclosure of mesh steel construction, incorporating sliding mechanically and electrically operated entrance gate, base electrical panel, base mast section, cable basket and bottom buffer. Spring assembly, cage with interlocking gates and drive unit (inside or outside of car), safety devices and cage operator control system.
Referencing details	Capacity or max load and speed per minute. Age.
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Tech2	Floor to height 6.4m
Unit size	-
Unit of measurement	Each
ERC	£23,957
Superseded codes	211A53
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Shafts for goods or passenger lifts. Serving floors at 3m intervals and constructed of steel stanchions, beams and braces with brick infill 225mm thick. Motor room constructed of steel frame with profiled steel sheeting enclosure. Pit formed in concrete, including bases for lift shaft stanchions (cost of lift not included).
Referencing details	Measure external dimensions, wall thickness and count number of floors served or total height of shaft.
Cost information notes	Excludes the cost of the lift cage and mechanisms.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Lightning conductors
CG Code	203X60
Specific	Copper
Descriptive	Earthing mats with connectors
Tech1	900mm x 900mm
Tech2	3mm thick
Unit size	Linear metre
Unit of measurement	m
ERC	£393
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Copper strip bar on all tall objects but mainly chimneys and towers. The top usually extends 1 metre above the structure. The bottom finishes in an earthing rod (min 2.44m depth), which is either hammered into the ground or encased in concrete. In some cases this earth is in the form of a mat set in a pit (where unable to put a rod into the ground). Diameter of earthing rods are 16mm or 20mm. Earthing mats are 900mm x 900mm x 3mm and are buried in pit at least 450mm deep
Referencing details	Thickness and width of band and height/length.
Cost information notes	Earthing mats and rods may not be accessible to identify on the ground. Unless record drawings indicate sizes and locations note of location only will be practicable. Where rods and mats cannot be specifically identified, costs for lowest range items may be used.
rateable element	Class 2 Table 2 (f) Protection from Hazards Lightning conductors (This would include the earth rod) Earth mat and pit (i) Foundations
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Adjusted Plant and Machinery	-
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Back

Generic Category	Lightning conductors
CG Code	203X02
Specific	Copper
Descriptive	Strip
Tech1	50mm wide
Tech2	6mm thick
Unit size	Linear metre
Unit of measurement	m
ERC	£127
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Copper strip bar on all tall objects but mainly chimneys and towers. The top usually extends 1 metre above the structure. The bottom finishes in an earthing rod (min 2.44m depth), which is either hammered into the ground or encased in concrete. In some cases this earth is in the form of a mat set in a pit (where unable to put a rod into the ground). Diameter of earthing rods are 16mm or 20mm. Earthing mats are 900mm x 900mm x 3mm and are buried in pit at least 450mm deep.
Referencing details	Thickness and width of band and height/length.
Cost information notes	Earthing mats and rods may not be accessible to identify on the ground. Unless record drawings indicate sizes and locations note of location only will be practicable. Where rods and mats cannot be specifically identified, costs for lowest range items may be used.
rateable element	Class 2 Table 2 (f) Protection from Hazards Lightning conductors (This would include the earth rod) Earth mat and pit (i) Foundations
non rateable element	-
Adjusted Plant and Machinery	-

Superseded codes	98B005
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with damp proof membrane (DPM) and Mesh, 250mm thick due to specialist nature of building up to 10,000m2; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	GEA
Cost information notes	Single storey insulated medium process factory building. Excludes any piling and external works. The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Descriptive	Kilns
Tech1	Measured as Gross External Volume (GEV)
Tech2	-
Unit size	m3
Unit of measurement	m3
ERC	£2,043
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Kiln designs are typically simple circular or rectangular, lined stainless steel vessels with a heat source at the bottom, one or two floors — perforated for air flow — to hold the grain, and vents at the top for air evacuation. The modular construction allows for quick and accurate erection at site. Heating systems utilise modern indirect firing methods and as kilning is a highly energy-intensive process, most malting plants use various heat exchangers to reclaim heat from the hot air that leaves the kiln.
Referencing details	External volume of the kiln. Construction details.
Cost information notes	-
rateable element	Kilns, being a named item in Class 4 Table 4
non rateable element	-
Adjusted Plant and Machinery	Other Class 4 items of plant for consideration as being rateable will include:- Rail tracks and transfer ways for kiln cars Weighbridge pits

ERC	£1,089
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with damp proof membrane (DPM) and Mesh, 250mm thick due to specialist nature of building up to 10,000m2; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Underslab storm drainage from internal downpipes on building area greater than 1,000m2;
Referencing details	GEA
Cost information notes	Single storey insulated medium process factory building. Excludes any piling and external works. The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GEA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Descriptive	Kilns
Tech1	Measured as Gross External Volume (GEV)
Tech2	-
Unit size	m3
Unit of measurement	m3
ERC	£2,043
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Kiln designs are typically simple circular or rectangular, lined stainless steel vessels with a heat source at the bottom, one or two floors — perforated for air flow — to hold the grain, and vents at the top for air evacuation. The modular construction allows for quick and accurate erection at site. Heating systems utilise modern indirect firing methods and as kilning is a highly energy-intensive process, most malting plants use various heat exchangers to reclaim heat from the hot air that leaves the kiln.
Referencing details	External volume of the kiln. Construction details.
Cost information notes	-
rateable element	Kilns, being a named item in Class 4 Table 4
non rateable element	-

Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Masts
CG Code	860A24
Specific	Lattice - light duty
Descriptive	Tubular metal framing - triangular or square
Tech1	Base width from 1.0m to 7.0m
Tech2	36m
Unit size	-
Unit of measurement	m
ERC	£2,177
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Freestanding tower, triangular or square on plan, comprising galvanized tubular steel legs with lattice work rod or angle section bracing struts. Mass concrete foundations or individual concrete bases to all legs and complete lightning protection and triangular steel mount. Heights range from 15-60m. Typically the sides of a triangular shaped tower can be up to 7m on plan at base and the tower can comprise of 6m long sections.
Referencing details	Height of mast Sizes of foundation blocks Age
Cost information notes	Includes normal foundation

Description	A picocell provides more targeted coverage specific to a particular environment such as within a building. These are normally found inside buildings where coverage is poor or where there are a high number of users such as airport terminals, train stations or shopping centres. They are designed to service specific requirements, hotels, conference centres, floors in buildings, and individual businesses/companies. The power levels are far lower than that of a micro cell determined by the specific requirements of facility to be covered. The coverage is significantly less than micro cells, but antennae can provide 360 degree short distance coverage or uni-directional coverage dependent upon design of site.

Tech1	Guy wires to fixed anchor blocks
Tech2	30m
Unit size	-
Unit of measurement	m
ERC	£2,060
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Lattice mast, triangular on plan, comprising 3 legs of galvanised tubular steel, cross braced with welded metal bars and mounted on a steel base pin encased in concrete pedestal 2m high. All on mass concrete foundation. Mast supported by four sets of triple guys of steel wire, each set fixed to a concrete anchor block. Complete with lightning conductor, cable tray inside structure and galvanised paint finish.
Referencing details	Measure height Age
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	Control buildings, cables, cable tray
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Mechanised coal depots
CG Code	52A00K
Specific	Handling
Descriptive	Bagging Plant
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£692
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Cost is for a typical bagging shed found at mechanised coal depots but also other mineral handling and bagging plants. The cost provided is for a typical steel portal framed structure which is frequently two storey to provide access to lorries from hoppers on the second floor. The upper part is normally clad with plasticoated steel profile sheeting to roof and walls. The shed can also feature concrete loading ramps, lean to roof over the loading canopy. Cost includes electric light and power.
Referencing details	Measure to GEA m2
Cost information notes	Based on Industrial Building 7m Eaves; uninsulated. Excludes external works or any plant & machinery
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	Conveyors, trestles, pits, walkways, hopper supports if separate from frame of building
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. Generic Category	Offices (Fitting out)
CG Code	34000E
Specific	Cat B (Previously Cat A - Major)
Descriptive	Cat B is the complete fit out also known as 'Plug & play' - An office ready for occupation
Tech1	Cost of Cat B is added to Code 34000A & 34000C to give a complete build up from Inception to Cat B fit out
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£398
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	A Cat B fit out can include additional items such as Wall, Floor & Ceiling decorated to certain styles, Floorings, Workstations, furniture, door & window treatments, Lighting, partitioning. (NB Not Costed: Cat B plus - A tailor made solution to identify the needs of the business, with style & creativity, design & brand detailing)
Referencing details	-
Cost information notes	Cost is the difference between Cat A & Cat B fit outs

Generic Category	Offices (Fitting out)
CG Code	34000A
Specific	Shell & Core (Previously Cat A - Minor)
Descriptive	A building framework that appears complete from the outside, is watertight and is ready to have all services such as power, lighting & heating installed, interior walls boarded & plastered, floors in place & the interior fit out completed
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£1,245
Superseded codes	STS025
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Shell & Core is a solid building structure but little else. A building bare and gutted of any interior fittings, fixtures, electrical & mechanical work - the brickwork shell space. Although the office is a shell, looking like a bare construction site, the common areas will be completed, e.g. lifts, toilets and building reception. Usually core areas are completed ready for incoming tenants

Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Variations	Pitched aluminium sheet roof add 42P0V3; Suspended ceiling add using code 42P0V1; Quarry tiled floors add using code 42P0V4. Central heating add using code 42P0V5. 5-7% of construction costs to be deducted for shared wall depending upon long or short side and proportions of the walls.

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Construction: Foundations: Reinforced concrete strip foundations and insulated concrete floor slab on hardcore. Roof: Steel deck flat roof with mineral felt External Walls: Brick /block cavity walls with painted blockwork internally. Windows and Doors: uPVC Double Glazed windows and doors; Internal Walls: Blockwork walls. Internal Finishes: Emulsion paint to blockwork walls and plastered ceilings, carpet tiles to office accommodation and vinyl flooring to wet areas. Building Services: Electric storage or wall mounted heaters. General lighting and power, hot and cold water supplies, reasonable quality sanitary appliances with local ventilation to toilets. Air handling not provided to offices.
Referencing details	Measure to GEA
Cost information notes	Excludes external works

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Variations	Pitched aluminium sheet roof add 42P0V3; Suspended ceiling add using code 42P0V1; Quarry tiled floors add using code 42P0V4. Central heating add using code 42P0V5. 5-7% of construction costs to be deducted for shared wall depending upon long or short side and proportions of the walls.

Description	Modern detached office building. Prestige offices as part of a chemical, oil, or other processing complex or operation. Constructed in high quality materials, contemporary design concealed services etc, for occupation in industrial locations. Construction: Substructure Pad foundations and reinforced 200mm thick concrete ground slab. Frame: concrete or steel. Minimum storey height 3m to accommodate air conditioning. Upper floors: Composite precast concrete with screed topping. Roof: Pitched roof with high quality profiled metal sheeting or slate / tile covering. External walls: Brick cavity wall, rain screen; metal, cladding, curtain walling etc. or a combination of these materials. Windows and Doors: Coated aluminium double glazed windows and external doors automatic / revolving. Internal walls and partitions: Mainly open plan blockwork walls plaster finish and paint some areas with specialised finishes. Toilet cubicles veneer finishes etc. Internal doors: solid doors hardwood veneer finish in hardwood frame matching skirtings and architraves. Floor finishes: High quality raised access flooring, heavy duty edged outlets. Carpets and vinyls often laid to patterns. Stone or ceramic to common areas. Ceiling finishes: High quality suspended ceilings (concealed grid, moisture resistant, veneers, acoustic) with commensurate computer light fitments. Fittings: Feature areas such as an atrium to the reception / entrance area with hardwood furniture. High quality kitchen (gloss, solid timber units marble work surfaces) and toilet accommodation. High quality / feature sanitary ware (low level close coupled toilets dual flush modern design). Tiled and well equipped kitchen many appliances stainless steel, servery etc. Air conditioning including heating and air cooling. 8 person Lift. Protective installations. Typically rateable firefighting equipment, fire alarms, lightning protection, CCTV and security systems included in the cost.
Referencing details	-
Cost information notes	Excludes external works.
rateable element	-
non rateable element	-

Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Each additional 8 person lift codes 335000 (Lift) & 211A01 (Shaft), use 335000 for platform lift only. Raised access floors 150mm high steel finish medium grade add using 31F1T5, and 31F1TA for heavy duty. Additional storey no impact on cost.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Pissoir
CG Code	217P01
Specific	Rising Urinal
Descriptive	Self contained hi tech pop up urinal.
Tech1	Mains Connected
Tech2	Remote Control
Unit size	-
Unit of measurement	Each
ERC	£105,769
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Usually located in city centre sites. These items are located below ground during the day but are raised up at night or at relevant times. They are usually raised and lowered by remote control but can be manually operated. The units have 3 stalls (urinals) with wing screens only and are located on a star basis. The unit is telescopic and thus requires a pit only half its height. The pit is concrete lined and has a connection to the main sewer. There is a hydraulic pump (and motor), which raises the central "pole " to which the Pissoir is attached. There is an electrical connection to the mains and a water connection to mains drainage for flushing purposes. The unit is illuminated at night. The pit is some 1.5m in dia. and 1.4 m depth. The Pissoir is some 2.2 m in height when fully extended.

Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Pits and ducts comprising 300mm thickness reinforced concrete walls and floors rectangular or square on plan. Excludes any pre cast material
Referencing details	Measure internal dimensions and wall thickness where practicable
Cost information notes	For adding a cover to pits and ducts add for the effective floor area of the pit the cost using code 3000V1 ; (in situ composite floor). For differing wall thicknesses adjust 300mm to reflect: 200mm (-20%), 400mm (21%) and 500mm (44%)
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

ERC	£133
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Pits and ducts comprising 300mm thickness reinforced concrete walls and floors rectangular or square on plan. Excludes any pre cast material
Referencing details	Measure internal dimensions and wall thickness where practicable
Cost information notes	For adding a cover to pits and ducts add for the effective floor area of the pit the cost using code 3000V1 ; (in situ composite floor). For differing wall thicknesses adjust 300mm to reflect: 200mm (-20%), 400mm (21%) and 500mm (44%)
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	Generally multi-storey building mainly comprising a custody suite, interview rooms and a van dock. Secondary operational accommodation includes various stores, locker rooms, shower and toilet facilities and offices in addition to ancillary space such as plant rooms. Other accommodation, such as a laboratory may also be present. Commonly of framed construction with a range of cladding to elevations surmounted by a flat or a metal clad pitched roof. Internal finishes and fixtures vary depending on accommodation usage with resin flooring, painted plaster or tiling to walls and fixed furniture to cells. Services comprise central heating, air conditioning, lighting and power with a back-up system, sanitary and plumbing installations with vandal resistant sanitary ware to custody areas, lifts, extensive data, communication and security installations including CCTV, cell call, fire detection and alarm systems. In addition, various sustainable features, such as photovoltaic panels, may be present.

Description	A shooting range, firing range or gun range, a specialized facility designed for firearms qualifications, training or practice. Firing range walls are usually constructed of poured concrete, precast concrete, or masonry block. The walls must be impenetrable and provide adequate ballistic protection from stray bullets and back splatter. Floors are constructed from dense reinforced concrete with a smooth surface finish. Floors are usually slanted slightly from up range (shooting lanes) toward the bullet trap downrange to allow for better maintenance and cleaning. Indoor firing range roofs are constructed from steel joists or precast concrete panels with a smooth flat surface that will redirect misfired bullets, facilitate maintenance, and prevent lead build-up. Roof baffles are installed at a 25–30 degree angle protect ceilings, lighting fixtures, ventilation ducts, and any other unprotected element from stray bullets. Baffles are typically constructed of armoured plate steel covered with fire-rated plywood. Deflectors are similar to baffles, but are not usually covered with plywood; they can be installed either vertically or horizontally and are used to redirect stray bullets from unprotected fixtures and elements inside the firing range such as doors, windows, and ventilation registers. Shields are constructed of plate steel and plywood. Control rooms or stations houses the central controls for the firing range equipment, communication, lights, and security. The controls are operated by the range master–the designated official responsible for range operation and management. The control station must provide the range master with unobstructed line of sight of the firing lanes and all shooters. Control stations are usually constructed of concrete blocks with bulletproof observation windows. Backstops and bullet traps are used to absorb the energy from the bullet and capture it to prevent overflight beyond the range area. Bullet traps come in a variety of designs and are usually constructed of impenetrable metal plates. The thickness of the plates and the

Tech2	67.27m²
Unit size	-
Unit of measurement	Each
ERC	£61,890
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Good quality standard units finished to a high standard and typically used for temporary school classrooms, medical facilities and offices. Internal layouts can be designed to exact user requirements. They are delivered in volumetric format (i.e. fully factory assembled) and are placed in position on concrete pads or similar hard-standing. Constructed of insulated plastic-coated steel externally with vinyl-faced plasterboard walls and polyester-coated steel ceiling internally. Doors are insulated steel-faced and windows are double-glazed. Single units may be linked and/or stacked to form larger complexes. Cost includes sheet vinyl floor covering, basic internal partitions, fluorescent lighting, socket outlets and electric convector heating units. Various optional extras are provided to suit individual requirements, these would include various floor coverings, suspended ceilings, under-floor heating and air conditioning.
Referencing details	Measure GEA.
Cost information notes	Costs include pad foundations (12no x 1m x 1m x 1m) an electrical service connection, 20m trench allowed. All other external work is excluded e.g. gravel beneath the cabin or stairs / ramp. Internally, sheet vinyl floor coverings, fluorescent strip lights and 13 amp socket outlets have been included in the price.

Generic Category	Portable buildings
CG Code	42U45A
Specific	Rubb shelters
Descriptive	Galvanised steel framework
Tech1	PVC covering
Tech2	R.C slab and strip beam
Unit size	-
Unit of measurement	m2
ERC	£524
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Rubb prefabricated portable structures and buildings have two common features, a galvanised steel frame and a PVC impregnated polyester fabric cover which is tensioned over the frame to provide a tight fitting shell. Variations include provision of alternative materials such as steel cladding or aluminium frame members. Any length of Rubb structure is possible in single span width of between 3 metres to over 79 metres (gap between ribs 3m to 5m). Multispan options are also available to provide for even larger structures. Side and gable walls are vertical to provide maximum space utilisation. These buildings are temporary structures although they have a reasonable life expectancy of over twenty years. Such buildings are frequently used for storage purposes and have minimum mechanical and electrical services. Foundations are a reinforced power-floated concrete slab and perimeter ring beam to which the steel frame is attached. Services include incoming electric service providing basic industrial lighting.
Referencing details	Measure GEA.
Cost information notes	Cost includes a perimeter ring foundation (29m x 0.3m x 0.3m) with a 50mm gravel top to hide anchor connections. There is an allowance for topsoil removal, 150mm type 1 stone and a 250mm slab reinforced with A393 mesh (1 layer). No external perimeter walls are included in the cost. All other external works and service connections are excluded. Although lighting and electrics can be added to the structure, none is included in the cost..

Descriptive	10m x 2.96m
Tech1	2.8m int height
Tech2	29.60m²
Unit size	-
Unit of measurement	Each
ERC	£33,377
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Utility standard units finished to a good standard and typically used for temporary offices, canteens and changing rooms. Internal layouts can be designed to exact user requirements. They are delivered in volumetric format (i.e. fully factory assembled) and are placed in position on concrete pads or similar hard-standing. Constructed of insulated plastic-coated steel externally with polyester coated steel wall and ceiling linings internally. Doors are insulated steel-faced and windows are aluminium single-glazed with polyester finish. Single units may be linked and/or stacked to form larger complexes. Cost includes sheet vinyl floor covering, fluorescent lighting, socket outlets and electric convector heating units. Various optional extras are provided to suit individual requirements; these include internal partitions, various floor coverings, external staircases and air conditioning.
Referencing details	Measure GEA.
Cost information notes	Cost includes pad foundations (6no x 1m x 1m x 1m) an electrical service connection with a 20m trench allowed. All other external work is excluded e.g. gravel beneath the cabin or stairs / ramp. Internally, sheet vinyl floor coverings, fluorescent strip lights and 13 amp socket outlets have been included in the cost.

Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Public conveniences
CG Code	63F01L
Specific	Semi Automatic
Descriptive	Range of 3 built in cubicles
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	Each
ERC	£153,273
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	These are essentially modular cubicles, which can be distinguished from conventional public conveniences in that the street door is the door of cubical. When installed in ranges, they therefore present an array of doors. The toilet can be built within an existing building or as a stand alone unit. Features include no touch flush, direct access and no touch exit. The cubicle is equipped with a full range of security equipment and conforms with the Disability Discrimination Act. This unisex cubicle is designed to accommodate all sectors of the public including those with children and less able users. Features include automatic locking and unlocking, high specification wooden clad doors, vandal resistant interior, automatic hand washing facility, No touch flush, backup automatic flush, Baby change, Sharps, nappy and litter disposal and computer controlled lighting and heating.
Referencing details	-
Cost information notes	Cost includes connection to mains services.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If a concrete flat roof is required, deduct using code 63M0V1. Gross External Area (GEA) in lieu of pitch roof. Cost excludes heating installations.

Generic Category	Railways
CG Code	219C15
Specific	Buffers
Descriptive	Buffer stops
Tech1	Double raker
Tech2	steel rail and timber; 2.5 tonnes approximate weight.
Unit size	Each
Unit of measurement	Each
ERC	£22,448
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Cost is for a basic buffer stop at the end of the line in sidings etc. There are no mechanical or electrical parts. Cost includes for all excavation, construction of buffer and material parts.
Referencing details	-
Cost information notes	All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.
rateable element	Class 3 (a) Associated fixed accessories and equipment Wood II 8.6 (iii) Buffers,..... Ballast and sub ballast are assumed to be rateable as part of the land on which tracks are laid and the cost thereof should be included within the improved land value.
non rateable element	-
Adjusted Plant and Machinery	Track
Number of items adjusted	The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component’s = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition” within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Descriptive	Buffer stops
Tech1	Single raker
Tech2	steel rail and timber; 2.0 tonnes approximate weight
Unit size	Each
Unit of measurement	Each
ERC	£20,085
Superseded codes	219C11, 219C12, 219C13, 219C17
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Cost is for a basic buffer stop at the end of the line in sidings etc. There are no mechanical or electrical parts. Cost includes for all excavation, construction of buffer and material parts.
Referencing details	-
Cost information notes	All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.
rateable element	Class 3 (a) Associated fixed accessories and equipment Wood II 8.6 (iii) Buffers,..... Ballast and sub ballast are assumed to be rateable as part of the land on which tracks are laid and the cost thereof should be included within the improved land value.
non rateable element	-
Adjusted Plant and Machinery	Track
Number of items adjusted	The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component’s = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition” within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Catch points and Trap points are types of turnout which act as railway safety devices. Both work by guiding railway carriages and trucks from a dangerous route onto a separate, safer track. Catch points are used to derail vehicles which are out of control on steep slopes (known as runaways). Trap points are used to protect main railway lines from unauthorised vehicles moving onto them from sidings or branch lines.

Generic Category	Railways
CG Code	219X02
Specific	Rail road crossings
Descriptive	Railway level crossing across a one carriageway wide road
Tech1	Manually operated timber gates
Tech2	-
Unit size	linear metre
Unit of measurement	Each
ERC	£7,141
Superseded codes	219G01, 219G02, 219X01
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	These occur when the railway line crosses a road. It is unusual for this to occur across a public highway and the assessment is in the same occupation. There are occasions where the crossing is within a privately owned hereditament. In the latter case the gates are opened manually at the crossing but normally cameras - relays will indicate a train arrival and the gates will be operated. Train speeds on site are very low. The road width will usually be such that a single arm would be sufficient.
Referencing details	The width of the arm and the means of operation. i.e. opened at the point of crossing or remotely via a control room. The distance between the arms (single track or double track). The number of arms (usually 2). The construction of the roadway round the rail track. (usually this is concrete or tarmac but some crossings adopt a flexible material)
Cost information notes	All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.
rateable element	Crossings - gates - barriers
non rateable element	-
Adjusted Plant and Machinery	Track support and foundations, sleepers, settings and fittings.
Number of items adjusted	The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. Generic Category	Railways
CG Code	219S02
Specific	Supports for overhead line work
Descriptive	One track electrification
Tech1	Concrete base, Cantilevered steel support
Tech2	-
Unit size	Each
Unit of measurement	Each
ERC	£6,976
Superseded codes	219GA1, 219GA2, 219R01, 219R02, 219S01
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Usually consisting of an I section stanchion set in a concrete base at regular intervals at the side of the track. These stanchions carry the support wires, which in turn support the power cables over the track. For areas where several power cables are supported I sections of 100mm x 200mm can be found whereas when the support is over a single track a 100 mm diameter pole is adopted. Support wires hold the power cables or an insulated support holds the power wire direct.
Referencing details	The section and type of stanchion is required. The height from the foundation and intervals if relevant. It is assumed that the stanchion is set in a concrete foundation. For Gantries the type of construction and size of the gantry is required as well as the height above the foundation.
Cost information notes	All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.
rateable element	Power wire. Supports. Power wire gantries
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Railways
CG Code	219V02
Specific	Viaducts
Descriptive	Concrete
Tech1	Double track
Tech2	-
Unit size	For 25m Plus span
Unit of measurement	m2
ERC	£5,217
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Reinforced in situ concrete viaduct including excavation, reinforcement, formwork, concrete, bearings, expansion joints, deck waterproofing, deck finishings, parapet
Referencing details	The total length, width& the height to the underside of the arches and the number and width of each arch. The type of construction and materials used. The Viaduct may carry the railway or carry a road / waterway over the railway. This should be noted. Do Not Walk on viaduct unless officially accompanied.
Cost information notes	All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.
rateable element	Viaduct
non rateable element	Furniture such as lights, notices regarding height etc.
Adjusted Plant and Machinery	Track, sleepers, points etc.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Railways
CG Code	219W50
Specific	Works - non standard gauge
Descriptive	Wide gauge
Tech1	Rail track on concrete base
Tech2	Length per section of parallel track
Unit size	linear
Unit of measurement	m
ERC	£387
Superseded codes	219W01, 219W20
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Most track is standard gauge 4 ft 8.5 inches. the engines and wagons could run on the main rail networks. Within factories and mineral hereditaments are rail tracks that have been built to suit the particular activity being undertaken. Tracks may be narrow gauge or in factories extra wide as are the tracks that support Overhead Transport (OHT) and cranes. Factory floor tracks are often just set in concrete and have no visible sleepers or ballast.
Referencing details	The width of the track, the length of track, the settings for the track & the use of the track
Cost information notes	All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.
rateable element	Class 3 (a) (i) to (vi) inclusive.
non rateable element	-
Adjusted Plant and Machinery	-

Unit of measurement	Each
ERC	£124,396
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In

Referencing details	(a) Number (Refinery serial no) and user i.e. No 1 Crude, 2nd stage distillation etc. (b) Overall height - including skirt. (c) Diameter - in the case of columns of varying diameters the length diameter of each different section should be given. (d) Height of skirt whether clad or bricked. (e) If lagged - the material used, its thickness and details of outer cover. (f) Operating pressure. (g) Weight of shell steel tonnes (excluding trays) (h) Weight of skirt in steel tonnes (where this is included in the shipping weight of the column it should be so indicated). (j) Weight of trays and if they are fixed. Also weight of tray supports. (k) Thickness in mm of shell and skirt. (l) Total weight in steel tonnes of stairs, ladders catwalks, etc., attached to column. (m) Details of foundation work - other than oversite concrete, including piling, mass and Reinforced Concrete work, pits, chambers other under-ground works. (n) Throughput in gallons or barrels per day or per steam day. (o) Materials used in construction particularly linings (known as cladding on the trade) *Weight calculations to be made as follows: - 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly
Cost information notes	The tower is under pressure and is therefore a pressure vessel. Fabrication costs are high and site erection costs are more due to the nature of structure.
rateable element	Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation
non rateable element	Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.

(c) Diameter - in the case of columns of varying diameters the length diameter of each different section should be given. (d) Height of skirt whether clad or bricked. (e) If lagged - the material used, its thickness and details of outer cover. (f) Operating pressure. (g) Weight of shell steel tonnes (excluding trays) (h) Weight of skirt in steel tonnes (where this is included in the shipping weight of the column it should be so indicated). (j) Weight of trays and if they are fixed. Also weight of tray supports. (k) Thickness in mm of shell and skirt. (l) Total weight in steel tonnes of stairs, ladders catwalks, etc., attached to column. (m) Details of foundation work - other than oversite concrete, including piling, mass and Reinforced Concrete work, pits, chambers other under-ground works. (n) Throughput in gallons or barrels per day or per steam day. (o) Materials used in construction particularly linings (known as cladding on the trade) *Weight calculations to be made as follows: - 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly
Cost information notes	The tower is under pressure and is therefore a pressure vessel. Fabrication costs are high and site erection costs are more due to the nature of structure.
rateable element	Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation
non rateable element	Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure
Adjusted Plant and Machinery	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Number of items adjusted	Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In

Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly
Cost information notes	Columns are costed with regard to their weight of steel. The basic steel usually adopted is Carbon Manganese steel however care must be given to the steel Cost Information as more modern columns are often made from high quality specialised steel. This would increase the price/stone (stainless steel and cast iron costs are provided). The Tables assume standard construction plate thickness and materials. In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for Class 4 purposes the skirt should be included.
rateable element	Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation
non rateable element	Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure
Adjusted Plant and Machinery	Ladders and Platforms Add to the above costs in respect of all columns Where details of ladders and platforms are known, see 215N for costs;
Number of items adjusted	Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In

Referencing details	(a) Number (Refinery serial no) and user i.e. No 1 Crude, 2nd stage distillation etc. (b) Overall height - including skirt. (c) Diameter - in the case of columns of varying diameters the length diameter of each different section should be given. (d) Height of skirt whether clad or bricked. (e) If lagged - the material used, its thickness and details of outer cover. (f) Operating pressure. (g) Weight of shell steel tonnes (excluding trays) (h) Weight of skirt in steel tonnes (where this is included in the shipping weight of the column it should be so indicated). (j) Weight of trays and if they are fixed. Also weight of tray supports. (k) Thickness in mm of shell and skirt. (l) Total weight in steel tonnes of stairs, ladders catwalks, etc., attached to column. (m) Details of foundation work - other than oversite concrete, including piling, mass and Reinforced Concrete work, pits, chambers other under-ground works. (n) Throughput in gallons or barrels per day or per steam day. (o) Materials used in construction particularly linings (known as cladding on the trade) *Weight calculations to be made as follows: - 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly
Cost information notes	Columns are costed with regard to their weight of steel. The basic steel usually adopted is Carbon Manganese steel however care must be given to the steel Cost Information as more modern columns are often made from high quality specialised steel. This would increase the price/stone (stainless steel and cast iron costs are provided). The Tables assume standard construction plate thickness and materials. In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for Class 4 purposes the skirt should be included.
rateable element	Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation
non rateable element	Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure

In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for Class 4 purposes the skirt should be included.
rateable element	Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation
non rateable element	Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure
Adjusted Plant and Machinery	Ladders and Platforms Add to the above costs in respect of all columns Where details of ladders and platforms are known, see 215N for costs;
Number of items adjusted	Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In

Referencing details	(a) Number (Refinery serial no) and user i.e. No 1 Crude, 2nd stage distillation etc. (b) Overall height - including skirt. (c) Diameter - in the case of columns of varying diameters the length diameter of each different section should be given. (d) Height of skirt whether clad or bricked. (e) If lagged - the material used, its thickness and details of outer cover. (f) Operating pressure. (g) Weight of shell steel tonnes (excluding trays) (h) Weight of skirt in steel tonnes (where this is included in the shipping weight of the column it should be so indicated). (j) Weight of trays and if they are fixed. Also weight of tray supports. (k) Thickness in mm of shell and skirt. (l) Total weight in steel tonnes of stairs, ladders catwalks, etc., attached to column. (m) Details of foundation work - other than oversite concrete, including piling, mass and Reinforced Concrete work, pits, chambers other under-ground works. (n) Throughput in gallons or barrels per day or per steam day. (o) Materials used in construction particularly linings (known as cladding on the trade) *Weight calculations to be made as follows: - 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly
Cost information notes	Columns are costed with regard to their weight of steel. The basic steel usually adopted is Carbon Manganese steel however care must be given to the steel Cost Information as more modern columns are often made from high quality specialised steel. This would increase the price/stone (stainless steel and cast iron costs are provided). The Tables assume standard construction plate thickness and materials. In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In
Referencing details	1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly.

Cost information notes	Columns are costed with regard to their weight of steel. The basic steel usually adopted is Carbon Manganese steel however care must be given to the steel Cost Information as more modern columns are often made from high quality specialised steel. This would increase the price/stone (stainless steel and cast iron costs are provided). The Tables assume standard construction plate thickness and materials. In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for Class 4 purposes the skirt should be included.
rateable element	Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation
non rateable element	Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure
Adjusted Plant and Machinery	-
Number of items adjusted	Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Generic Category	Refining
CG Code	213A27
Specific	Fractionation Towers
Descriptive	Stainless steel (excel int trays)
Tech1	7.5m diameter, 30m high
Tech2	318 tonnes
Unit size	one
Unit of measurement	Each
ERC	£9,426,723
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In
Referencing details	1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly.

Cost information notes	Columns are costed with regard to their weight of steel. The basic steel usually adopted is Carbon Manganese steel however care must be given to the steel Cost Information as more modern columns are often made from high quality specialised steel. This would increase the price/stone (stainless steel and cast iron costs are provided). The Tables assume standard construction plate thickness and materials. In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for Class 4 purposes the skirt should be included.
rateable element	Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation
non rateable element	Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure
Adjusted Plant and Machinery	-
Number of items adjusted	Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Refining and Gas Process
CG Code	213C01
Specific	Gas Process
Descriptive	Slug catcher
Tech1	-
Tech2	-
Unit size	linear metre
Unit of measurement	m
ERC	£3,554
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A complex pressure vessel known as a slug catcher, which separates gas, condensate and water, which has arrived from the oilfield beneath the sea or land. The incoming material is under pressures of over 1000 psig. The vessels are manufactured either from bent welded steel plate in tubular form or in the form of drop tanks (pressure vessels). The tubular construction can have sections of between 250 mm to 1 metre and the wall thickness can vary between 25 mm to 75 mm. Drop tanks consist of 3 - 4 tanks lying under an initial receiving tank. A Slug catcher is the structure of interconnected tubular steel pieces made to withstand pressure and intercept slugs of liquid contained within a pipeline and separate out from the gas stream. In gas lines from offshore and onshore wells, petroleum liquids (condensate) accumulate by dropping out or condensing and collecting in low sections in the line. When enough condensate (and water) collects the flow of gas is disturbed and the restricted volatile gas starts to change back into liquid causing more slugs to build up. At this point a "pig" is sent down the pipe to collect all the slugs together and it is this large build up of liquid that a slug catcher primarily separates into gas, water and condensate. A Slug is a compact mass of liquid, retaining its identity as it travels. The collection of liquid forming a large slug can amount to several thousand gallons and can travel along a pipe at up to 10 mph. When the slug arrives at the slug catcher consisting of condensate, Gas, and water all in a volatile state.
Referencing details	Length taken from the inlet manifold to the main gas off-take pipe: the cost per linear metre has been derived after consideration of all of the different diameters and wall thickness.
Cost information notes	-
rateable element	Class 4 Table 4 (tubular) separator Class 4 table 4 (drop tank) tank / separator Machine to sort or divide into parts or sizes
non rateable element	Instruments and controls. Exclude pipes taking gas / condensate from the slug catcher If Class 4 (d) is applicable
Adjusted Plant and Machinery	Settings, foundations, supports
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Descriptive	Granite Setts, laid to pattern, includes excavation and base
Tech1	200mm x 100mm x 80mm thick
Tech2	Laid to a pattern
Unit size	-
Unit of measurement	m2
ERC	£138
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Overall 325mm thick. 150mm hardcore base layer compacted and blinded with sand, setts laid to pattern in sand and cement mortar. Includes excavation, but excludes drainage.
Referencing details	-
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Roof
CG Code	30FO8F
Specific	Cladding - covering
Descriptive	Slates
Tech1	Asbestos free artificial slates
Tech2	Fibre cement
Unit size	-
Unit of measurement	m2
ERC	£35
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	These are man made manufactured slates designed to replicate the asthetics of natural slates but at a lower cost. Traditionally they were made with asbestos but now made with alternative man made fibres in order to provide strength and thin artificial slates. Generally coloured dark grey or black, individual slates have a uniform look and shape. With age explosure to solar radiation their colour lightens. They are fixed with clips or nails to treated timber battens.
Referencing details	Measure to roof area =m2 when practicable - Age and condition.
Cost information notes	Cost includes treated battens and fixing and standard felt underlay to the roof slopes.

Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£408
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Patent glazing - Aluminium alloy glazing bars 2m-3m long at about 600mm centres glazed with double glazed GeorGEAn wired glass. Includes basic frame system. Patent Glazing is the term applied to a self-draining system of dry glazing that does not rely necessarily for its water tightness upon external glazing seals. It consists essentially of a series of longitudinal supporting members (glazing bars), and an infilling of glass or other suitable materials. Patent glazing bars are attatched to and supported upon suitable structural members provided by others.

Descriptive	Felt
Tech1	3 layers
Tech2	Mineral faced
Unit size	-
Unit of measurement	m2
ERC	£27
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Flat or low-sloping roof often surfaced with alternating layers of roofing felt known as built-up, or tar-and-gravel roof. Felt flat roofing systems are made from a build up of several layers of roofing felt. These layers are usually bound together with molten liquid bitumen. Cold bonding agents are sometimes used. The methods of fixing are usually referred as roll and pour or torchon. To protect the felt from the effects of solar radiation the top layer has a mineral coating, fine stone chips often light green in colour.

Description	A flat roof can be constructed out of timber, steel or concrete using similar construction methods to floors. Flat or low-sloping roof is often waterproofed using asphalt which has to be protected from the damaging effects of solar radiation using either limestone chippings, solar reflective paint, paving slabs etc. Cost includes for 20mm asphalt in 20mm thickness with a solar reflective paint finish.

Description	Patent glazing is the term applied to a self-draining system of dry glazing that does not rely necessarily for its water tightness upon eternal glazing seals. It consists essentially of a series of longitudinal supporting members (glazing bars), and an infilling of glass or other suitable materials. Patent glazing bars are attatched to and supported upon suitable structural members provided by others.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	Fibreglass matting is usually available in rolls 40mm (16in) wide, is not ridged and is laid between the ceiling joists. To meet modern insulation standards of 250mm - 300mm it is frequently installed in two layers, the first between the ceiling joists and the second laid at right angles covering the joists. The thickness of each layer can be different but is usually either 100mm or 150mm thick.

Generic Category	Roof - structure
CG Code	30F120
Specific	Structure
Descriptive	Eaves detail
Tech1	Gutters and softwood facias
Tech2	112mm UPVC gutter on brackets; screwed to timber
Unit size	Per Linear Metre
Unit of measurement	m
ERC	£161
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Wrought softwood - Eaves, verge soffit boards, fascia boards etc. plywood external - 18mm thick. 225mm wide. Roof members; flat 38?mm?×?75?mm. Knot; one coat primer; two undercoats and one finishing coat of gloss oil paint; on wood surface General surfaces-over 300 mm girth. 112 mm UPVC gutter on brackets -112 mm half round gutters; on brackets; screwed to timber.
Referencing details	Length - Per Linear Meter Run. Also down pipes.
Cost information notes	PVC gutters are made from unplasticised poly vinyl chloride. The sections and fittings are lighter, easy to fix and do not require painting. Cast Iron Gutters are long lasting if painted regularly and the insides primed with zinc chromate paint. The finishing coat can be a bituminous paint. Cast Iron is heavy and today other materials such as aluminium gutters are used in place of cast iron

non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	Steel roof trusses and beams. A pitched roof is a form of ridge roof sloping down in two directions from a central apex or ridge as it is technically called. A steel trussed roof structure comprises multiple structural members including rafters, struts and ties welded or mechanically bolted together to form a triangulated structure commonly known as a roof truss. Steel roof trusses provide a frame on which to clad both slopes with a weather proof sheet or tile covering.

Specific	Burried Cable
Descriptive	2 x parallel cables
Tech1	Burried in trench
Tech2	Max length 400m
Unit size	m
Unit of measurement	m
ERC	£69
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Buried service cables in trench nominally min 750mm deep. Excavated by machine and backfilled. Identification tape included.
Referencing details	-
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	CCTV, alarm systems
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	A security system comprising four or more cameras, which are linked to a central monitoring, control and recording area. Cameras can be found both internally and externally within factory or commercial hereditaments. Where more than four cameras are employed either large split screens or multiple screens are usually used for monitoring. Recording is now generally on a computer hard drive or DVD / CD-ROM. Systems can form part of an integrated security / observation operation and the pre amble to Class 2 should be studied. (See rateable and non-rateable elements)
Referencing details	It is not intended to rate isolated cameras. A system comprises four or more cameras. The number of cameras should be recorded. CCTV systems for traffic or shopping mall security should not be rated.
Cost information notes	System comprises: - camera, lense, mounting brackets, housing, cabling back to monitoring station, control / recording equipment and display monitors. Installers do not manufacture the equipment but assemble the various component parts to form a bespoke system. There is no additional discount for additional cameras. Total system cost should be built up using listed component costs.

CG Code	208S53
Specific	Security Camera Systems
Descriptive	Modern Digital
Tech1	In terms of installed system
Tech2	12 camera system
Unit size	Each
Unit of measurement	Each
ERC	£2,629
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A security system comprising four or more cameras, which are linked to a central monitoring, control and recording area. Cameras can be found both internally and externally within factory or commercial hereditaments. Where more than four cameras are employed either large split screens or multiple screens are usually used for monitoring. Recording is now generally on a computer hard drive or DVD / CD-ROM. Systems can form part of an integrated security / observation operation and the pre amble to Class 2 should be studied. (See rateable and non-rateable elements)
Referencing details	It is not intended to rate isolated cameras. A system comprises four or more cameras. The number of cameras should be recorded. CCTV systems for traffic or shopping mall security should not be rated. System comprises: - camera, lense, mounting brackets, housing, cabling back to monitoring station, control / recording equipment and display monitors.
Cost information notes	Installers do not manufacture the equipment but assemble the various component parts to form a bespoke system. There is no additional discount for additional cameras. Total system cost should be built up using listed component costs.
rateable element	Class 2 Table 2 (f) PROTECTION FORM HAZARDS security and alarm systems together with list of accessories 2(i), (v), (vii), (viii)
non rateable element	-
Adjusted Plant and Machinery	Supporting structures (other than mounting brackets that are included in the cost), foundations, security fences, gates, barriers.
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Reinforced concrete tank with base normally set below ground and the outer wall above ground level. Used for the bacteriological treatment of sewage by mechanical agitators. There is usually a safety rail to the top of the wall.
Referencing details	Gross internal Volume (GIV) m3
Cost information notes	Costs are to include the supporting structure (often concrete) for the agitators which will often double up as walkways (handrails to be included). Costs are to exclude any mechanical plant, including the agitators and motors.
rateable element	Class 4 Table 4 Tanks See Paragraphs under Rateable element in sewage works: Definitions and Referencing Aids.
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.
Adjusted Plant and Machinery	-
Number of items adjusted	Security lighting
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

ERC	£4,244
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Used to elevate effluent to a greater height thereby invoking a stronger gravity flow for further stages of treatment. Within the screw house there is normally one chamber in which the bottom end of the screw(s) rest and a further chamber at the top of the screw(s) to receive the elevated effluent. The screws sit in an inclined conduit. There is normally a protective grille over the screw(s). The motor mechanism powering the screw(s) is sometimes located within a housing structure at the top of the screw chamber.
Referencing details	Gross Internal Volume of the whole structure
Cost information notes	The costs include the chambers, the screw pumps and the channel they reside within, screws, protective grills and handrails, the costs do not include the buildings, staircases or any other elements. i.e. meica

Generic Category	Sewage treatment works
CG Code	63M1A2
Specific	Archimedean screw housing
Descriptive	Inclined chambers and conduits
Tech1	120.0m3 - 144.0m3
Tech2	-
Unit size	-
Unit of measurement	m3
ERC	£3,936
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Used to elevate effluent to a greater height thereby invoking a stronger gravity flow for further stages of treatment. Within the screw house there is normally one chamber in which the bottom end of the screw(s) rest and a further chamber at the top of the screw(s) to receive the elevated effluent. The screws sit in an inclined conduit. There is normally a protective grille over the screw(s). The motor mechanism powering the screw(s) is sometimes located within a housing structure at the top of the screw chamber.
Referencing details	Gross Internal Volume of the whole structure
Cost information notes	The costs include the chambers, the screw pumps and the channel they reside within, screws, protective grills and handrails, the costs do not include the buildings, staircases or any other elements. i.e. meica
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	This unit is constructed of Glass Reinforced Plastic (GRP). The unit has within it a moving part (usually a disk), which is impregnated with biological organisms. When the surface of this moving part comes into contact with the effluent within the unit, the organisms on the moving part interact with and neutralise many of the harmful bacteria in the effluent. Bio Disk units are used both as part of the treatment process in medium to small works, and often as a self-contained treatment process for single dwellings or for small works. These units are generally sunk into the ground, but this is not always the case. Where a unit is sunk into the ground there may be a concrete foundation underneath the unit if the load bearing capacity of the soil is not sufficient. The gap between the unit and the pit wall is then backfilled with either concrete or pea shingle. Where the ground has a particularly high-water table level the Bio Disk Unit may be set within its own concrete pit. Similar- Submerged aeration filters (SAF plants) and other similar GRP units will also be set into the ground.
Referencing details	Additional cost of reinforced concrete base slab to pit ref 63M1B1. Cost provided as £/m2.
Cost information notes	Costs in for all these items are to exclude the provision of handrails, access stairs or internal walls. They are also to exclude the mechanical plant including the disk itself and any motors.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	The double membrane biogas storage tank has been developed for low-pressure dry gas storage. The outer membrane is made from polyester fabrics with special PVC surface treatment and acrylate finish and has strengthening bands where each panel is welded to the next. The inner tank, which is more flexible than the outer, consists of a bottom membrane sealed to an inner membrane. There are pipes built into the concrete foundations, which are sealed where they pass through the bottom membrane. These are for gas supply and discharge. A separate pipe is installed for condensation discharge. The tank is anchored to the reinforced concrete foundation by an anchorage ring, which is cast into the slab and sealed to the bottom membrane.
Referencing details	Gross Volume m3 of the sphere.
Cost information notes	Costs include excavation, construction of a tank base, anchor ring, collar, and pipe connections for the storage tank only. Costs exclude foundations associated with condensate chambers, lightning protection, surrounding paving, interconnecting pipework between gas holding tank and any other equipment outside of the perimeter of the tank.

Descriptive	Concrete base slab = 107m²
Tech1	400m³ tank
Tech2	400mm thick base
Unit size	-
Unit of measurement	Each
ERC	£36,208
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The double membrane biogas storage tank has been developed for low-pressure dry gas storage. The outer membrane is made from polyester fabrics with special PVC surface treatment and acrylate finish and has strengthening bands where each panel is welded to the next. The inner tank, which is more flexible than the outer, consists of a bottom membrane sealed to an inner membrane. There are pipes built into the concrete foundations, which are sealed where they pass through the bottom membrane. These are for gas supply and discharge. A separate pipe is installed for condensation discharge. The tank is anchored to the reinforced concrete foundation by an anchorage ring, which is cast into the slab and sealed to the bottom membrane.
Referencing details	Gross Volume m3 of the sphere.
Cost information notes	Costs include excavation, construction of a tank base, anchor ring, collar, and pipe connections for the storage tank only. Costs exclude foundations associated with condensate chambers, lightning protection, surrounding paving, interconnecting pipework between gas holding tank and any other equipment outside of the perimeter of the tank.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Referencing details	When additional finishes are found it will be necessary to initially calculate the volume of the basement and further, the surface area of each additional finish.
Cost information notes	The Cost provided here is for the cost of constructing a basement, to a basic standard, in relation to its Volume (m3). Where additional finishes are applied to walls and floors, an addition needs to be made to this cost for providing such finishes. This cost excludes stairs, plinths, walkways etc.
rateable element	Rateable as part of the "land and buildings.
non rateable element	-
Adjusted Plant and Machinery	Settings and supports.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Sewage treatment works
CG Code	63M0A9
Specific	Chambers
Descriptive	Brick or concrete
Tech1	Over 750.0m³
Tech2	-
Unit size	-
Unit of measurement	m3
ERC	£306
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Reinforced concrete chambers normally set below ground. May contain internal concrete walls or half walls however some are situated where pipes/conduits meet and are free of internal walls. Perimeter walls may project above ground by some 300mm. Walls usually 250mm thick.
Referencing details	Gross internal Volume (GIV) m3
Cost information notes	The costs should include an element for a safety rail typically 1200mm high with uprights every 1500mm. The steel being galvanised and 60mm tubular. Manhole types may well have a metal cover. For larger chambers walkways, platforms often covering entire open area of chamber are to be excluded from the cost.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Sewage Treatment Works
CG Code	63M01A
Specific	Combined Workshop and Garage
Descriptive	Single storey two bay garage and workshop
Tech1	< 250m²
Tech2	Steel portal frame with mono pitch roof over cavity brickwork
Unit size	250m²
Unit of measurement	m2
ERC	£1,081
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Single Storey, two bay garage with workshop. Construction: Steel portal frame with mono-pitched roof over cavity brickwork. Solid concrete floor, blockwork internal partitions. Two roller shutter doors and one personnel door. Basic staff welfare facilities with toilet and heating. General lighting and power.
Referencing details	Measure to GEA. Measure Eaves Height. Photograph internally and externally. Identify if plant and machinery and three phase electrical supply provided.
Cost information notes	Cost includes basic electrical provision, heating, wall, ceiling and floor finishes. Manual roller shutter doors.
rateable element	Refer to Rating Manual Section 5a: Valuation of all property classes - Sewage Treatment Works and relevant Practice note
non rateable element	Refer to Rating Manual Section 5a: Valuation of all property classes - Sewage Treatment Works and relevant Practice note
Adjusted Plant and Machinery	Identify and record details
Number of items adjusted	Identify and record details
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. Generic Category	Sewage treatment works
CG Code	63M0G1
Specific	Conduits - open topped channels
Descriptive	Concrete walls and base
Tech1	Cross section area of conduit or flume
Tech2	<= 1m²/linear metre
Unit size	-
Unit of measurement	m2
ERC	£463
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Conduits are of reinforced concrete construction either situated above or below ground level usually having an open top. They are laid flat or to falls. The conduit varies in width and depth depending on the flow of liquids at that part of the process however it is unusual for the depth to be greater than 1.0m. The width normally is in the range 300mm to 3.0m but can be up to 10.0m. They are usually rectangular in section, with the height greater than the width. Includes all associated works to supply, construct a concrete conduit (Channel) consisting of walls, bases, foundations.
Referencing details	Costed on a rate m2
Cost information notes	Excludes access arrangements, piling and/or any other element not described above. The cost is to exclude, any handrails or safety fencing built onto the conduit.

ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Sewage treatment works
CG Code	63M0DE
Specific	Dividing walls
Descriptive	Concrete reinforced
Tech1	600mm thick
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£219
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Common in chambers and tanks as dividing walls are reinforced concrete walls of various widths from 150mm to 600mm. Certain chambers and tanks at STW will require additions for these internal walls.
Referencing details	Where practicable measure length and thickness. Depth may be difficult to obtain unless plans and sections are available.
Cost information notes	Costs are for a rate /m2 area of concrete wall
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. Generic Category	Sewage treatment works
CG Code	63M1C1
Specific	Dortmund tanks
Descriptive	Conical or pyramidal base
Tech1	Over 100.0m³ - 250.0m³
Tech2	-
Unit size	-
Unit of measurement	m3
ERC	£717
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	These normally consist of a square tank with the base comprising of an inverted pyramid. They are normally made of reinforced concrete and used for settlement. Tanks normally set below ground with an up stand topped with a safety rail. Cost includes up stand and safety rail. The gross internal volume includes the volume of the weir.
Referencing details	Gross internal Volume (GIV) m3
Cost information notes	Additional cost should be added for handrails, walkways, elevated tanks or conduits, supporting concrete structure and foundations using rates for reinforced concrete beams and columns (Category: Frames: Reinforced Concrete, Foundations: Isolated Bases Item: Concrete - Reinforced).
rateable element	Class 4 Table 4 Tanks
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.
Adjusted Plant and Machinery	Security lighting, walkways.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). CG Code	63M1E2
Specific	GRP covers
Descriptive	To tanks and chambers
Tech1	Glass reinforced plastic (GRP)
Tech2	Upto 50m2
Unit size	-
Unit of measurement	m2
ERC	£460
Superseded codes	63M1E1
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Covers are frequently made of Glass Reinforced Plastic. The covers will normally be brought to site in sections and then bolted together. The covers are also bolted in place over the tanks, being a permanent feature of the works and are not designed to be removed in the normal operational process.
Referencing details	-
Cost information notes	Area of cover in m2
rateable element	Covers may be rateable as part of the tank over which they sit. Tanks are a named item under Class 4 Table 4. Under Class 4 (b) covers will only be rateable if they form an integral part of the tank over which they are situated. Deciding if a cover is an integral part of a tank is a question that will need to be resolved in each separate case. Factors that point to the cover being an integral part of the tank are: a strong degree of fixation between the cover and the tank; the cover is a substantial structure in its own right; the cover cannot easily be removed; the cover is seldom if ever removed and the cover is designed to be in place during normal operating conditions. Odour control is a feature of the works on which the covered tank(s) are found.
non rateable element	-

Under Class 4 (b) covers will only be rateable if they form an integral part of the tank over which they are situated. Deciding if a cover is an integral part of a tank is a question that will need to be resolved in each separate case. Factors that point to the cover being an integral part of the tank are: a strong degree of fixation between the cover and the tank; the cover is a substantial structure in its own right; the cover cannot easily be removed; the cover is seldom if ever removed and the cover is designed to be in place during normal operating conditions. Odour control is a feature of the works on which the covered tank(s) are found.
non rateable element	-
Adjusted Plant and Machinery	Security lighting, Conduits
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Sewage treatment works
CG Code	63MGP1
Specific	GRP tanks
Descriptive	Conical
Tech1	1.0m upstand edge wall
Tech2	3.0m diam
Unit size	-
Unit of measurement	m3
ERC	£2,043
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Moulded Glass Reinforced Plastic (GRP) conical settlement tanks. GRP construction with corrosion resistant reinforcement specifically selected for sewage and wastewater applications. Usually formed from a series of flanged sections which are bolted together and have a non-biodegradable sealant sandwiched between the flanges. Units of 2.5 to 3 metre diameter are usually delivered to site completely assembled, whilst larger units (up to 7 metre diameter) are usually delivered in sections and assembled on site. Available with 55º (shallow excavation) or 60º cone. Used as primary, final or storm settlement tanks. The tanks are designed and usually installed below ground, although there is the option of above ground installation (mounted on a galvanised steel frame). The general design and construction is such that the completed tank will withstand both internal and external pressures and will only require a lean-mix concrete surround to eliminate pressure points on the tank skin and provide additional mass to compensate for high ground water table conditions. The lower portion of the tank is usually anchored to a concrete base slab and will also usually have a base frame to provide an anchor and levelling facility. Once the other sections of the tank are positioned, fixed, sealed, and bonded the tank is ready for backfilling.
Referencing details	Gross internal Volume (GIV) m3
Cost information notes	The costs should exclude handrails, bridges and mechanical handling equipment.

Description	Specialist caustic coating. Preparation by grit blasting; one coat primer; one layer 600 gramme fibreglass resin matting, resin wash; preparation and application of topcoat sealer.
Referencing details	Caustic coating per m2 surface area of coating with support services priced additionally.
Cost information notes	Cost excludes access, support scaffolding and waste skip and is priced separately under support services.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Sewage treatment works
CG Code	63M1H1
Specific	Reed beds
Descriptive	Excavated area
Tech1	Butyl lining
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£76
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Reed beds are formed by excavating an area of land, lining the excavation (usually with butyl), then covering it with soil. Carefully selected reeds are then planted within the topsoil. Effluent flows into the bed and allowed to remain there for a period of time, during which organisms that naturally occur within the roots of the reeds have the effect of neutralising harmful bacteria found within the effluent.
Referencing details	Area of bed m2
Cost information notes	Rate excludes adjacent structures, chambers or gabions, paths and walls. Rate also excludes brick or concrete walling to the bed itself.
rateable element	Class 4 Table 3 Beds (It is the lined bed that is rateable)
non rateable element	The reeds themselves are not rateable nor is the medium filling the beds.
Adjusted Plant and Machinery	Chambers, Conduits, Security lighting.
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. Generic Category	Sewage treatment works
CG Code	63M0E1
Specific	Sedimentation or Humus Tanks - Circular
Descriptive	Circular tanks
Tech1	Reinforced concrete
Tech2	100.0m³ - 250.0m³
Unit size	-
Unit of measurement	m3
ERC	£471
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	A circular reinforced concrete sedimentation tank consisting of a central well, a sloping cone, vertical walls, and an outer weir. The angle of the sloping cone is usually 7.5 degrees or 10 degrees occasionally up to 30 degrees to the horizontal and allows for the settlement of sludge in the central bottom cone. The tank is normally set below the ground with an up stand topped with a safety rail. Cost includes up stand and safety rail. The cost excludes the bridge/ walkway and any mechanical equipment. The gross internal volume includes the volume of the weir.
Referencing details	Referencing of these items is very difficult and NO attempt must be made to climb on the surrounding apparatus in order to establish depths of the cylinder, cone or sump. Ask for suitable plans and take all of the measurements from them. Calculate GIV = m3. The calculation only includes part of the volume of the sump/pit, however, as the volume of the residue of the sump is relatively small the difference may be disregarded. The total diameter should include the weir.
Cost information notes	For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rateability regard is to be given to the total cubic capacity in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item).
rateable element	Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.
Adjusted Plant and Machinery	Security lighting, Walkways, Bridges.
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	For cost of Bridges see Category: Stairs, walkways.
