Referencing details	Referencing of these items is very difficult and NO attempt must be made to climb on the surrounding apparatus in order to establish depths of the cylinder, cone or sump. Ask for suitable plans and take all of the measurements from them. Calculate GIV = m3. The calculation only includes part of the volume of the sump/pit, however, as the volume of the residue of the sump is relatively small the difference may be disregarded. The total diameter should include the weir.
Cost information notes	For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rateability regard is to be given to the total cubic capacity in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item).
rateable element	Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.
Adjusted Plant and Machinery	Security lighting, Walkways, Bridges.
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	For cost of Bridges see Category: Stairs, walkways.

ERC	£225
Superseded codes	205G01
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	A circular reinforced concrete sedimentation tank consisting of a central well, a sloping cone, vertical walls, and an outer weir. The angle of the sloping cone is usually 7.5 degrees or 10 degrees occasionally up to 30 degrees to the horizontal and allows for the settlement of sludge in the central bottom cone. The tank is normally set below the ground with an up stand topped with a safety rail. Cost includes up stand and safety rail. The cost excludes the bridge/ walkway and any mechanical equipment. The gross internal volume includes the volume of the weir.

Description	A circular reinforced concrete sedimentation tank consisting of a central well, a sloping cone, vertical walls, and an outer weir. The angle of the sloping cone is usually 7.5 degrees or 10 degrees occasionally up to 30 degrees to the horizontal and allows for the settlement of sludge in the central bottom cone. The tank is normally set below the ground with an up stand topped with a safety rail. Cost includes up stand and safety rail. The cost excludes the bridge/ walkway and any mechanical equipment. The gross internal volume includes the volume of the weir.
Referencing details	Referencing of these items is very difficult and NO attempt must be made to climb on the surrounding apparatus in order to establish depths of the cylinder, cone or sump. Ask for suitable plans and take all of the measurements from them. Calculate GIV = m3. The calculation only includes part of the volume of the sump/pit, however, as the volume of the residue of the sump is relatively small the difference may be disregarded. The total diameter should include the weir.
Cost information notes	For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rateability regard is to be given to the total cubic capacity in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item).
rateable element	Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.
Adjusted Plant and Machinery	Security lighting, Walkways, Bridges.
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	For cost of Bridges see Category: Stairs, walkways.

The tank is normally set below ground with a 1 metre up stand topped with a safety rail. Cost includes sump construction, up stand and safety rail. Cost excludes bridges, mechanical handling equipment and any dividing wall/s. The gross internal volume excludes the volume of the weir.
Referencing details	Gross Internal Volume. Internal dividing walls measured as m2 of wall area
Cost information notes	For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rating the volume is Gross External in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item). Dividing wall additional costs apply to all tanks over 100m3
rateable element	Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.
Adjusted Plant and Machinery	Security lighting, walkways, platforms and stairs, bridges.
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Sewage treatment works
CG Code	40POOA
Specific	Sedimentation tanks
Descriptive	Dorr thickener or clarrifloculator
Tech1	12m diam
Tech2	289m³
Unit size	per m3 Gross Internal Volume
Unit of measurement	m3
ERC	£290
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	A Dorr thickener is a particular type of sedimentation tank- usually of concrete construction, open topped and having a central tower commonly found in sewage treatment works. Sizes range from 10-200m diameter. The actual thickener comprises an underwater raking mechanism and a drive head which supplies motive power. A fixed bridge may be present and windshields may be provided to the larger diameter tanks particularly in exposed locations. Access tunnels may be provided to the central tower. Generally constructed at two thirds wall depth below ground level. A Clarrifloculator is of similar construction and is used for removing solids from water that has been used to clean gas or air. It contains a small diameter steel or concrete tank (flocculating chamber) without top or bottom. Additives (reagents) are mixed with the fine solids suspended in the water in the flocculating chamber. These solids cling together and settle to the bottom of the tank, the water being agitated by moving paddles. Rotating rakes and the sloping base of the tank funnel the solids away to a central sludge withdrawal pipe from where they are pumped away .The tank may contain a series of concrete troughs (launders) at the perimeter and near the surface of the water, with perforations to assist the recovery of the purified (supernatant) water. Generally constructed with two thirds wall depth below ground level. For cost purposes the rate provided is in terms of Gross Internal Volume.
Referencing details	Gross internal Volume (GIV) m3
Cost information notes	NOTE: The rate does not include tank equipment, gantries or bridges
rateable element	Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways

Additives (reagents) are mixed with the fine solids suspended in the water in the flocculating chamber. These solids cling together and settle to the bottom of the tank, the water being agitated by moving paddles. Rotating rakes and the sloping base of the tank funnel the solids away to a central sludge withdrawal pipe from where they are pumped away .The tank may contain a series of concrete troughs (launders) at the perimeter and near the surface of the water, with perforations to assist the recovery of the purified (supernatant) water. Generally constructed with two thirds wall depth below ground level. For cost purposes the rate provided is in terms of Gross Internal Volume.
Referencing details	Gross internal Volume (GIV) m3
Cost information notes	NOTE: The rate does not include tank equipment, gantries or bridges
rateable element	Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.

Adjusted Plant and Machinery	Security lighting, Walkways, Bridges. Stairs and platforms
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	A Dorr thickener is a particular type of sedimentation tank- usually of concrete construction, open topped and having a central tower commonly found in sewage treatment works. Sizes range from 10-200m diameter. The actual thickener comprises an underwater raking mechanism and a drive head which supplies motive power. A fixed bridge may be present and windshields may be provided to the larger diameter tanks particularly in exposed locations. Access tunnels may be provided to the central tower. Generally constructed at two thirds wall depth below ground level. A Clarrifloculator is of similar construction and is used for removing solids from water that has been used to clean gas or air. It contains a small diameter steel or concrete tank (flocculating chamber) without top or bottom. Additives (reagents) are mixed with the fine solids suspended in the water in the flocculating chamber. These solids cling together and settle to the bottom of the tank, the water being agitated by moving paddles. Rotating rakes and the sloping base of the tank funnel the solids away to a central sludge withdrawal pipe from where they are pumped away .The tank may contain a series of concrete troughs (launders) at the perimeter and near the surface of the water, with perforations to assist the recovery of the purified (supernatant) water. Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Concrete or metal tank with steeply sloping reinforced concrete base (up to 45 degrees) used for digesting sludge to produce sludge gas, which is used as a fuel in the production of electricity. Heat is controlled by way of hot water/steam heating pipes in order to maintain a constant temperature. Sludge lies in the tank on average 14 to 30 days. Walls of tank are insulated if constructed of metal. Cost includes formed tank bottom but do not include the heavy raft or piles that may be employed under this heavy tank. There is always a lightning conductor on the roof, and this is an additional cost.
Referencing details	Gross internal Volume (GIV) m3 - if plans not available obtain sludge working volume and add 10% for gas volume above sludge.
Cost information notes	The costs should include the tank cover but exclude any mechanical plant or heating equipment and any tank ladders or handrails.
rateable element	Class 4 Table 4 Tanks
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Reinforced concrete tanks, either rectangular or circular, generally built with a flat or slightly sloping base. Sump at one end or centrally. The cost includes the concrete base but exclude any mechanical handling equipment and control valves.
Referencing details	Gross internal Volume (GIV) m3
Cost information notes	Costs exclude any tank cover.
rateable element	Class 4 Table 4 Tanks Note: Some metal tanks are under 400m3 but the bottom is concrete (not metal) and these are rateable (Class 4(d)).
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.
Adjusted Plant and Machinery	Security lighting
Number of items adjusted	Security lighting
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Concrete Tanks - Dividing Walls: additional cost for tanks over 100m3 GIV see dividing walls.

Description	Reinforced concrete rectangular tank with a shallow gradient floor. Used for the storage of storm water prior to its return for treatment through the works. Tank normally set mostly below ground level. Each tank has an outlet sump, and this is included in the volume. There is normally an overflow chamber to allow for direct flow to the watercourse in extreme conditions. Cost includes safety rail but excludes any overflow chamber.
Referencing details	Gross Internal Volume (GIV) m3
Cost information notes	For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rateability regard is to be given to the total cubic capacity in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item).
rateable element	Class 4 Table 4 Tank
non rateable element	Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non rateable.
Adjusted Plant and Machinery	Security lighting, walkways, stairs, platforms.
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Specific	Tertiary treatment tank
Descriptive	Concrete rectangular
Tech1	Over 50.0m³ - 62.0m³
Tech2	-
Unit size	-
Unit of measurement	m3
ERC	£499
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	An additional treatment used on some works for the final polishing of effluent before disposal into watercourse. Reinforced concrete tank, part filled with media usually set below ground level. Wall 300 mm above ground with safety rail set in. Cost includes safety rail but excludes any walkways, filtration media and mechanical plant.
Referencing details	Gross Internal Volume (GIV) m3
Cost information notes	Costs are to exclude any dividing wall/s however the Contractor is required to provide a separate cost for dividing walls. Costs are to include the safety rail.
rateable element	Class 4 Table 4 Tank
non rateable element	-
Adjusted Plant and Machinery	Security lighting
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Unit of measurement	m2
ERC	£1,334
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	High quality standard units finished to a high standard and typically used for prestigious offices, marketing suites and similar applications. Internal layouts can be designed to exact user requirements. They are delivered in volumetric format (i.e. fully factory prefabricated) and are placed in position on concrete pads or similar hard standing. Constructed of insulated plastic-coated steel externally with vinyl-faced plasterboard walls and polyester-coated steel ceiling internally. Doors are insulated steel-faced and windows are UPVC double glazed with low energy glass. The system uses complete modules to construct buildings with unlimited floor area; additional storeys may be added at any time (up to a maximum of four). Various optional extras are provided to suit individual requirements; these include various floor coverings, suspended ceilings, under floor heating and air conditioning.
Referencing details	Record GEA m2. External walls to be measured as per elevation.

Generic Category	Silo
CG Code	43560A
Specific	Flat bottomed - maxi bin
Descriptive	Galvanised steel with ribbed roof
Tech1	Diameter 7.31m
Tech2	350m3
Unit size	-
Unit of measurement	m3
ERC	£125
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Commonly referred to as 'maxi bins'. Walls are constructed of galvanised curved corrugated steel sheets, lapped, double bolted and sealed with mastic at base. Incorporating an access door, the structure has a conical ribbed roof with central filler hatch and internal access ladder, side handrails and handrails at high level.
Referencing details	Holding volume of bin in order to calculate Gross Volume. External works.
Cost information notes	Based on the volume of the hopper. Costs are for a single hopper. Costs include supporting steelwork but exclude foundations. For a heavy duty roof add 30%. For galvanised steel add 10% to cost.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

(Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Silo
CG Code	43560H
Specific	Flat bottomed - maxi bin
Descriptive	Galvanised steel with ribbed roof
Tech1	Diameter 10.97m
Tech2	580m3
Unit size	-
Unit of measurement	m3
ERC	£130
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Commonly referred to as 'maxi bins'. Walls are constructed of galvanised curved corrugated steel sheets, lapped, double bolted and sealed with mastic at base. Incorporating an access door, the structure has a conical ribbed roof with central filler hatch and internal access ladder, side handrails and handrails at high level.
Referencing details	Holding volume of bin in order to calculate Gross Volume. External works.
Cost information notes	The costs are for single bins but as most installations will have several bins often linked with gantries / walkways with caged access ladders from ground level, these items will need to be added separately. Wheat = 0.77 tonnes/m3, Barley = 0.69 tonnes/m3. Cost includes foundations and erection costs. For quantities of 5 - 10 bins allow 10% discount, these discounts also apply to catwalks and ladders.

Description	Walls constructed of galvanised curved corrugated steel sheets, lapped, double and bolted - incorporating access door, conical ribbed roof with central filler hatch and internal access ladder, side handrails and handrails ar high level. Hopper cone may be 40, 45 or 60 degrees. The hopper is raised above a concrete slab with steel coloumns attatched to a curved ring beam. The columns are usually diagonally braced.
Referencing details	Holding volume of bin in order to calculate Gross Volume. External works.
Cost information notes	Rates include for concrete base slab, steelwork supports, roof and cone outlet. The costs are for single bins but as most installations will have several bins often linked with gantries / walkways with caged access ladders from ground level, these items will need to be added separately. On very high bins outside sheeting may be taken to ground level. Wheat = 0.77 tonnes/m3, Barley = 0.69 tonnes/m3. Cost includes foundations and erection costs. For quantities of 5 - 10 bins allow 10% discount. For quantities of 10 or more bins allow 15% discount. These discounts also apply to catwalks and ladders used in conjunctions with silos.
rateable element	Silo rateable under Class 4 Table 4, - not rateable if Class 4 (d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved.

Tech1	Diameter 7.31m
Tech2	234m3
Unit size	-
Unit of measurement	m3
ERC	£214
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Walls constructed of galvanised curved corrugated steel sheets, lapped, double and bolted - incorporating access door, conical ribbed roof with central filler hatch and internal access ladder, side handrails and handrails ar high level. Hopper cone may be 40, 45 or 60 degrees. The hopper is raised above a concrete slab with steel coloumns attatched to a curved ring beam. The columns are usually diagonally braced.
Referencing details	Holding volume of bin in order to calculate Gross Volume. External works.
Cost information notes	Rates include for concrete base slab, steelwork supports, roof and cone outlet. The costs are for single bins but as most installations will have several bins often linked with gantries / walkways with caged access ladders from ground level, these items will need to be added separately. On very high bins outside sheeting may be taken to ground level. Wheat = 0.77 tonnes/m3, Barley = 0.69 tonnes/m3. Cost includes foundations and erection costs. For quantities of 5 - 10 bins allow 10% discount. For quantities of 10 or more bins allow 15% discount. These discounts also apply to catwalks and ladders used in conjunctions with silos.
rateable element	Silo rateable under Class 4 Table 4, - not rateable if Class 4 (d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved.
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Add for gantries, walkways and conveyors
Photo description	Typical steel hopper bottomed silo for cement, fuel ash or similar materials

Generic Category	Silo
CG Code	43523A
Specific	Hopper Bottomed more than 6m diameter
Descriptive	Steel plate
Tech1	2mm
Tech2	200m3
Unit size	-
Unit of measurement	m3
ERC	£259
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	A circular hopper bottomed structure of sheet steel plate of varying thickness, including support steelwork.
Referencing details	Diameter, Gross Internal Volume and Age. Also details of foundations and piling where applicable.
Cost information notes	Based on the volume of the hopper. Costs are for a single hopper. Costs include supporting steelwork but exclude foundations. For a heavy duty roof add 30%. For galvanised steel add 10% to cost.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Add for gantries, walkways and conveyors

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Add for gantries, walkways and conveyors

Description	PVC coated galvanised wire mesh box, wire laced, graded broken stone filling. Dimensions of the base of these modular units are 1.0m x 2.0m. Used to build 'walls' often as retaining walls especially with Reed Beds.
Referencing details	Based on a cost / m3 of the caged units.
Cost information notes	-
rateable element	Rateable as part of the land.
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Grass Amenity grade grass grown on very hard-packed soil, similar to golf greens, surround and perimeter drainage. Grass courts are the fastest courts however, due to high maintenance costs, grass courts are now rare as they must be watered and mowed often, and take a longer time to dry after rain than hard courts. Site works: Cultivate, apply weed killer, sow tennis quality grass seed, harrow, roll and initial cut.

Generic Category	Solar Thermal Panels
CG Code	206S50
Specific	Solar Panels
Descriptive	Evacuated tube
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£1,184
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Solar thermal panels using vacuum tubes are the most efficient method of capturing solar radiation and turning it into useable heat, with efficiencies of over 90%. The system consists of the evacuated tube panel, insulated pipework, expansion vessel, controller pump, fittings and vented twin coil electric cylinder These should not be confused with Photo Voltaic (PV) panels that convert solar radiation (photons) into electricity. Includes Installation and access to roof.
Referencing details	Determine area of panels
Cost information notes	Panels are normally supplied in kits based on number of tubes per panel and will have length and width dimensions. Cost is per m2.
rateable element	Solar Panels, supports, controls and accessories may be rateable under Class 1 Table 1 (n) and List of Accessories but only if used mainly or exclusively in conncection with power. Will be rateable under Class 2 heating Table 2 (b) . Supports alone may be rateable under class 4 Table 3.
non rateable element	Cost includes supply and installation of panels, controls, pump, expansion vessel & vented cylinder, but excludes the cost of any hot water or heating system to which they may be connected.
Adjusted Plant and Machinery	-
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit of measurement	Each
ERC	£130,325
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Sports Ground Athletics Track - Floodlighting. Please note this is based on modern day equivalent based on 12 Columns - Each 22m high with lamps to provide 520 Lux. Modern installations mounted on a tubular steel column, which is hinged to allow it to be lowered for maintenance. Average illumination levels vary depending on use and standard of facility provided i.e. recreational to international. Different configurations of columns, column heights and number of lamps can be used to achieve the same average illumination. Cost includes 12 number columns as a package
Referencing details	Facilities subject to television coverage will require a minimum of 1000 Lux. Known media coverage suggests a higher cost should be selected.
Cost information notes	Factors affecting cost : Height and number of columns/lamp heads. Cost includes concrete foundations, 50m of external duct (per column) to permit a power supply. Cost excludes any provision to enhance an existing power supply to support this installation. Columns not hinged will have a lower capital cost but will attract a higher overall lifecycle cost due to enhanced maintenance costs i.e. cherry pickers for bulb replacement.

Generic Category	Sports grounds
CG Code	63P10L
Specific	Floodlighting
Descriptive	8 columns
Tech1	16m ht x 6 lamps
Tech2	806 lux
Unit size	-
Unit of measurement	Each
ERC	£111,558
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Sports Ground Athletics Track - Floodlighting. Please note this is based on modern day equivalent based on 8 Columns - Each 16m high with lamps to provide 806 Lux. Modern installations mounted on a tubular steel column, which is hinged to allow it to be lowered for maintenance. Average illumination levels vary depending on use and standard of facility provided i.e. recreational to international. Different configurations of columns, column heights and number of lamps can be used to achieve the same average illumination. Cost includes 8 number columns as a package
Referencing details	Facilities subject to television coverage will require a minimum of 1000 Lux. Known media coverage suggests a higher cost should be selected.
Cost information notes	Factors affecting cost : Height and number of columns/lamp heads. Cost includes concrete foundations, 50m of external duct (per column) to permit a power supply. Cost excludes any provision to enhance an existing power supply to support this installation. Columns not hinged will have a lower capital cost but will attract a higher overall lifecycle cost due to enhanced maintenance costs i.e. cherry pickers for bulb replacement.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Adjusted Plant and Machinery	Tanks, handrails, platforms
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Stairs, Ladders and Walkways
CG Code	215N04
Specific	Ladders
Descriptive	Metal caged ladders
Tech1	0.75mm dia. cage starts 2.5m above gl. 380mm wide, 250 centred rungs
Tech2	Galvanised
Unit size	-
Unit of measurement	m
ERC	£636
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Metal - Steel stairways, walkways are purpose made to specific designs in the factory and transported to site. Fixing in location is normally by fixing bolts (occasionally welded) and built up in workable sections. Usually galvanised but some items are specifically painted to customer requirements.

Generic Category	Stairs, Ladders and Walkways
CG Code	30K01F
Specific	Reinforced concrete staircase
Descriptive	Concrete with one metal handrail
Tech1	Standard flight straight 2.6m rise
Tech2	Plaster skim and paint to soffit
Unit size	-
Unit of measurement	Each
ERC	£8,318
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Reinforced concrete staircase and metal handrail to one side, 2.6m standard rise, no other finishes.
Referencing details	Either measure floor to floor height for dogleg type or measure horizontal length of stair case
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Stairs, Ladders and Walkways
CG Code	215N13G
Specific	Walkways, gantries
Descriptive	850mm wide galvanised
Tech1	Chequer plate base
Tech2	Handrail one side only
Unit size	-
Unit of measurement	m
ERC	£790
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Freestanding walkway comprising horizontal structural steel sub frame, steel deck with supports and tubular steel railings. (Note: Any vertical structural stanchions to support the walkway (e.g. at high level) are not included) or Attached walkway comprising horizontal steel angle frame bolted to adjacent wall, steel deck with supports and tubular steel railings on one side.
Referencing details	each item- width and length. handrails on one or both sides. Galvanised or painted
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	Walkways, stairs, platforms, supporting steelwork, tanks etc.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. Description	Steelwork - Fire Protection - A non-combustible board in which the unique cellular structure of vermiculite is maintained by a pre-treatment process. This gives excellent thermal insulation properties with dimensional stability at high temperatures. It is used extensively for the fire protection of structural elements in buildings such as steel beams and columns and to provide up to 4 hours fire protection. It may also be used to protect sheet metal ducts and for the construction of smoke extraction ducts.
Referencing details	Dimensions and weights of beams or columns.
Cost information notes	Cost given per m2 of board covering. Excludes decorative finish.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Intumescent paint coating to steel beams and columns to achieve 1 hour fire resistance. Decorative final coat. Heat in a fire triggers a catalytic reaction causing expansion of an insulating char layer up to 50 times the paint film thickness. This keeps the steel below its critical temperature thus maintaining the structural stability of the building.
Referencing details	-
Cost information notes	This is a paint coverage that was previously measured in tonnes and has now been corrected to m2 as per measurement rules. Excludes decorative finish. Unit price relates to weight of steel being protected. See also Item Codes 31A055/A/F/K/P/U/31A060/5.

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Single storey traditional construction with trapezoidal profile sheet roof covering laid on softwood trusses over one brick thick walls on concrete strip foundations, reinforced concrete ground floor slab with a trowelled finish. 1nr steel personnel door, 1nr electric industrial Roller Shutter door approx. size 3.5m x 3.0m. Basic electrical provision providing light and single phase 13amp power. No windows or roof lights provided. Basic rainwater goods and materials used for construction.
Referencing details	See Rating Manual Property Inspector Manual Section 5: Inspection of industrials
Cost information notes	Costs based on traditionally constructed equivalent modern replacement consisting brick walls, pitched trapezoidal roof on softwood trusses.
rateable element	Refer to Rating Manual Section 5a: Valuation of all Property Classes, Section 380 Factories, Workshops and Warehouses.
non rateable element	Refer to Rating Manual Section 5a: Valuation of all Property Classes, Section 380 Factories, Workshops and Warehouses.
Adjusted Plant and Machinery	Refer to Rating Manual Section 5a: Valuation of all Property Classes, Section 380 Factories, Workshops and Warehouses.
Number of items adjusted	Check on site and record
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	The building is a typical detached internal building with kitchen, serving area, dining room/tea bar, toilets, conference, training room, first aid, consulting and treatment rooms. Internal building, typical construction. External Walls: Timber framed with sheet material cladding, including sound absorption materials and plasterboard inner face. Windows and Doors: Extensive double or triple glazed upvc for insulation both for sound and heat protection. Half glazed door. Internal Walls: Timber stud partitions. Internal Finishes: Emulsion paint to plastered walls and acoustic tile ceilings, and vinyl floor tiles. Building Services: - General lighting and extra power sockets for equipment; heating; air conditioning; fire alarms and emergency lighting, sprinklers. These are for single internal structures within an existing building. Variations may include brick walls, timber windows, raised access floors, soft floor coverings and built between storey heights. Usually constructed as single concrete block or stud partition walling with a timber frame flat roof. Internally painted walls. Building services will include electrical power and lighting.

Tech1	Profiled Metal Partially Enclosed
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£406
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Canopies usually are extensions or attached to existing buildings for the purpose of providing shelter whilst loads are transferred. They may be cantilevered from the side of the building or simply supported on columns. Usually they will be roofed with a profiled metal deck system with guttering. They may be partially enclosed on one or more sides.
Referencing details	GEA - noting degree of enclosure. Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	Lighting costs are included. - Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Description	The building is a typical detached Mess building with kitchen, serving area, dining room/tea bar, toilets, conference, training room, first aid, consulting and treatment rooms. Building Construction most commonly found is reinforced concrete strip foundations with concrete ground slab with cavity brick/insulated concrete block external walls. The roof may be either a concrete or timber framed felted flat roof or in some case pitched roof with concrete roof tiles. The doors and windows are likely to be UPVC double glazed units but at older works traditional wooden or metal casement windows may still be found. Internal walls will be either single concrete block with plaster skimmed finish or plasterboard stud partitions with softwood doors and frames. The internal finish normally found will be emulsion paint to plastered walls and ceilings, vinyl flooring to wet areas and an epoxy resin floor screed in food preparation areas. The remaining internal areas can be floored with vinyl or carpet. Building services will include full gas central heating to steel panel radiators, air supply and extract system, general lighting and power, fire alarms, emergency lighting, reasonable standard of sanitary appliances.

Description	The cost is for a typical boiler house commonly found at industrial complexes. The building depending on foot print will range from a light steel to heavy steel frame off a reinforced concrete beam or slab foundation base. The infill will normally be cavity walls of brick and concrete block with an internal finish of emulsion painted skimmed concrete or plaster walls. Windows and doors will be traditional softwood doors and windows. The roof is generally a profiled decked bitumen felt covered flat roof construction but variations are to be expected. The internal finish is hardened concrete floors and no ceiling. The building services will include, but not exclusively, water, electrical power and lighting. You will often find internal buildings that accommodate plant room and staff rest room/office.
Referencing details	GEA - Applies to main floor area of boiler house (i.e. excludes intermediate floors. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	Excludes Boiler equipment external works. Adjustments may have to be made for variations found. Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
non rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Adjusted Plant and Machinery	External works, standby generators, boilers, oil storage tanks and chimney. Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Number of items adjusted	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Description	The cost is for a typical control room at an industrial complex and reflects a brick/block cavity walled building off a reinforced concrete strip foundations or slab. The roof will vary from basic flat timber framed felted roof to pitched roof with concrete roof tiles. There is likely to be extensive areas of glazing which will either be softwood or more recent build UPVC double glazed units. The access doors are also likely to be either softwood or UPVC. The internal finish will vary from a basic emulsion painted plastered walls and ceilings to more elaborate wall finishes. The flooring again will vary for basic vinyl floor tiles to carpeted areas. The cost includes for typical building services of electrical power and lighting, central heating and water. The cost does not include for any air handling systems that are now common place in such control rooms.
Referencing details	GEA - Applies to main floor area of boiler house (i.e. excludes intermediate floors. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Adjusted Plant and Machinery	Air handling systems. Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Number of items adjusted	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Sugar beet factories
CG Code	98A001
Specific	Flat Pad
Descriptive	Flat Concrete Storage Pad
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£113
Superseded codes	STS034
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Sugar beet is brought to site, weighed, sampled and laid on large flat concrete storage areas, known as flat pads, essentially a storage area. When required for processing, the beets are carried along flumes by running water which cleans the beet as it passes through machinery which separates soil, stones, weeds and other foreign matter before entering the factory.

Generic Category	Sugar beet factories
CG Code	98A005
Specific	Large concrete silos
Descriptive	20m diameter
Tech1	36m high
Tech2	225mm thick walls
Unit size	-
Unit of measurement	Tonnes
ERC	£167
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	These are large structures that will have been constructed in-situ and to the specification of the occupier. They are constructed of reinforced concrete off a prepared foundation base and the thickness of the concrete walls will be dictated by the height, diameter and intended holding capacity. The silos costed in this guide have wall thicknesses ranging from 225mm up to 275mm. The silo will usual have a conical internal base for discharge and at some point an access chamber and door. The cost is for the silo and excludes external works, external access stairways, platforms and ladders. Volume 9,712m3- capacity in sugar tonnes 8,000.
Referencing details	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	The cost provided here is based on a rate per tonne of holding capacity of sugar. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
non rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Descriptive	29m diameter
Tech1	42.00m high
Tech2	275mm thick walls
Unit size	-
Unit of measurement	Tonnes
ERC	£132
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	These are large structures that will have been constructed in-situ and to the specification of the occupier. They are constructed of reinforced concrete off a prepared foundation base and the thickness of the concrete walls will be dictated by the height, diameter and intended holding capacity. The silos costed in this guide have wall thicknesses ranging from 225mm up to 275mm. The silo will usual have a conical internal base to aid discharge and at some point an access chamber and door. The cost provided here is for the silo and excludes external works, external access stairways, platforms and ladders. Volume 23,530m3- capacity in sugar tonnes 20,000
Referencing details	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	The cost provided here is based on a rate per tonne of holding capacity of sugar. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
non rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Adjusted Plant and Machinery	Stairways, ladders, platforms and walkways. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Number of items adjusted	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

ERC	£0
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Internal buildings (excludes control buildings.) up to 50m2 in area and 3 metres in height. Typical Construction. External Walls: Timber framed with sheet material cladding, including sound absorption materials and plasterboard inner face. Windows and Doors: Extensive double or triple glazed upvc for insulation both for sound and heat protection. Half glazed door. Internal Walls: Timber stud partitions. Internal Finishes: Emulsion paint to plastered walls and acoustic tile ceilings, and vinyl floor tiles. Building Services: - General lighting and extra power sockets for equipment; heating; air conditioning; fire alarms and emergency lighting, sprinklers. These are for single internal structures within an existing building. Variation may include brick walls, timber windows, raised access floors, soft floor coverings and built between storey heights. Usually constructed as single concrete block or stud partition walling with a timber frame flat roof. Internal painted walls. Building services will include electrical power and lighting.
Referencing details	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	Includes steel support frame. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GEA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
non rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Adjusted Plant and Machinery	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Number of items adjusted	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an additionusing code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Adjusted Plant and Machinery	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Number of items adjusted	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an additionusing code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Sugar beet factories
CG Code	98A031
Specific	Main Factory Building
Descriptive	Insulated Factory Building
Tech1	Typically 2500m² GEA
Tech2	Eaves Height - 30m
Unit size	2500m²
Unit of measurement	m2
ERC	£0
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Underslab storm drainage from internal downpipes on building area greater than 1,000m²
Referencing details	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GEA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an additionusing code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Sugar beet factories
CG Code	98A040
Specific	Main Factory Building
Descriptive	Insulated Factory Building
Tech1	Typically 5000m² GEA
Tech2	Eaves Height - 17m
Unit size	5000m²
Unit of measurement	m2
ERC	£0
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Underslab storm drainage from internal downpipes on building area greater than 1,000m²
Referencing details	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GEA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
non rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Adjusted Plant and Machinery	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Number of items adjusted	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an additionusing code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Descriptive	Insulated Factory Building
Tech1	Typically 5000m² GEA
Tech2	Eaves Height - 26m
Unit size	5000m²
Unit of measurement	m2
ERC	£0
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Underslab storm drainage from internal downpipes on building area greater than 1,000m²
Referencing details	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GEA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
non rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Adjusted Plant and Machinery	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Number of items adjusted	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an additionusing code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GEA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Underslab storm drainage from internal downpipes on building area greater than 1,000m²
Referencing details	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Cost information notes	The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GEA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.
rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
non rateable element	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Adjusted Plant and Machinery	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories
Number of items adjusted	Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an additionusing code 41P1V4 (GEA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Generic Category	Swimming baths
CG Code	63Z00V
Specific	Open Air Pool unheated
Descriptive	Changing rooms, office ,stores, staff facilities & snack bar (Shell only)
Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£1,372
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Changing facilities & other accommodation. Strip foundations, cavity walls, timber roof with clay interlocking tiles fixed via battens and roofing felt to timber trussed rafters at 450mm centres. Roof void insulated with quilt. UPVC rainwater goods. Softwood internal doors. Aluminium windows and doors externally. Finishes to changing area : Ceramic Tiling to walls & floor. Ceiling finish : Moisture resistant plasterboard with a painted finish. Finishes to snack bar, pay kiosk & Office. Fair finished painted blockwork to walls, painted plasterboard soffit, vinyl safety floor including coved skirtings.
Referencing details	Please note this is a modern day equivalent cost thus there are specification changes. Cavity walls utilising facing bricks are provided in lieu of 100mm rendered block to all accommodation, the roof will incorporate additional building regulation requirements for thermal properties. Internal finishes are now provided to the facilities. Modesty lobbies have been included in the changing block as opposed to exiting from the poolside. Specification in line with Sport England with the exception of ceramic tiling to changing room walls due to facilities being wet as opposed to dry.
Cost information notes	A small number of cubicles are provided within the changing areas. Cost excludes fixtures, fittings & equipment and external works. With the exception of the snack bar, the cost for drainage, water installation & heating to all of the premises is included within the plant room code : 63Z00U. The snack bar has an allowance for drainage and water as it will require a dedicated supply.

Description	Outdoor pool to community standard based on a 25m x 10.50m pool with depth ranging from 0.9m in shallow end to 1.5m in deep end. Excludes diving area. Includes 2m pool surround, pool drainage and water filtration & treatment plant. Excludes pool heating. Pool constructed of reinforced waterproof concrete slab and walls including bulk excavation and disposal off site on a green field site without abnormal ground conditions. Allowance included for formed duct/scum/ filtration channel. Ceramic tiling to internal surfaces of the pool with walk in steps to comply with guidelines on accessibility. 2m concrete surround with 250mm thickness with ceramic tiling to reduce slippage. Increase rate by 15% for a heated pool. Also please note that the cost will reduce as the pool becomes larger, allow for a reduction of approximately 30% for a 50m x 12.50m pool.
Referencing details	Surface area of the pool. Please note the rate includes a 2m wide pool surround, which should not be included in the area for calculating hardstandings/paving.

Generic Category	Tanks
CG Code	215J02
Specific	Bitsand bases
Descriptive	Bitsand, sand cone
Tech1	% Addition
Tech2	See cost information Notes
Unit size	-
Unit of measurement	m3
ERC	£0
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Most bulk storage tanks are built with a cone up (sometimes cone down - with a central sump) which allows any water or any dense materials to separate out and through a drain hole be tapped and disposed of. To create the cone in concrete would not allow for expansion of the steel tank and would cause a water barrier that would assist the chemical reaction to cause rust. It is assumed that the sub foundations are solid. This may be rock or naturally dense well-compacted subsoil however where this sub strata is poor load bearing piles and large re-enforced concrete foundations are required. For costing of these foundations the relevant section in the cost guide should be consulted or where details are poor and an estimate required see Category Tanks Item Foundations (21V01 etc) When rock or naturally well-compacted subsoil is found either a 100mm concrete layer or well-compacted chemically inert fill is employed. Onto this layer is added a drainage layer of some 150mm usually of stable permeable compacted granular construction (sand for example). This layer is sloped to give the cone up profile. This layer allows some minor movement, as the steel tank will move due to expansion when heated. Onto this layer is added a mixture of sand and bitumen (50mm thick). This is known as the bit sand layer. The base plates are rested on the bit sand layer and then welded together. The transfer of heat through the metal melts the bitumen and forms a watertight seal to the underside of the tank. At present BS 2654 sets out the requirements for such bases. Bit sand bases may consist of (i) Bit sand layer, Sand cone layer, Base layer or 100mm concrete (ii) Bit sand layer Sand cone layer (iii) Sand only It will be noted that (ii) and (iii) will be sitting on a large concrete sub foundation which will be costed separately.
Referencing details	-
Cost information notes	The 10% addition is to the basic ERC tank cost. Additions for different or single layers over a solid concrete foundation should be added at 6% and 2.5% respectively.
rateable element	Class 4, Table 3 foundations and settings
non rateable element	-

Adjusted Plant and Machinery	Foundations, tank, walkways, stairways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. Generic Category	Tanks
CG Code	215F01
Specific	Braithwaite
Descriptive	Depth 1.22m (4ft)
Tech1	6.10m (20ft) x 3.66m (12ft)
Tech2	-
Unit size	-
Unit of measurement	Each
ERC	£41,989
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks - Potable Water - Braithwaite type. Braithwaite is a trade name that is used by the industry for this type of tank. Braithwaite tanks are mainly for water storage and are found sitting on brick or more commonly steel towers. In modern office complexes the tanks may be found on a building roof. Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.
Referencing details	The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.
Cost information notes	The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.
rateable element	Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).
non rateable element	Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).
Adjusted Plant and Machinery	Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Variations

Galvanised tanks require a 15% addition to Cost guide figures.

Description	Tanks - Potable Water - Braithwaite type. Braithwaite is a trade name that is used by the industry for this type of tank. Braithwaite tanks are mainly for water storage and are found sitting on brick or more commonly steel towers. In modern office complexes the tanks may be found on a building roof. Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.
Referencing details	The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.
Cost information notes	The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.
rateable element	Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).
non rateable element	Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).
Adjusted Plant and Machinery	Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Description	Tanks - Potable Water - Braithwaite type. Braithwaite is a trade name that is used by the industry for this type of tank. Braithwaite tanks are mainly for water storage and are found sitting on brick or more commonly steel towers. In modern office complexes the tanks may be found on a building roof. Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.
Referencing details	The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.
Cost information notes	The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.
rateable element	Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).
non rateable element	Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).
Adjusted Plant and Machinery	Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Variations

Galvanised tanks require a 15% addition to Cost guide figures.

Cost information notes	The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.
rateable element	Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).
non rateable element	Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).
Adjusted Plant and Machinery	Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Variations

Galvanised tanks require a 15% addition to Cost guide figures.

Description	Tanks - Potable Water - Braithwaite type. Braithwaite is a trade name that is used by the industry for this type of tank. Braithwaite tanks are mainly for water storage and are found sitting on brick or more commonly steel towers. In modern office complexes the tanks may be found on a building roof. Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.
Referencing details	The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.
Cost information notes	The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.

Description	Tanks - Potable Water - Braithwaite type. Braithwaite is a trade name that is used by the industry for this type of tank. Braithwaite tanks are mainly for water storage and are found sitting on brick or more commonly steel towers. In modern office complexes the tanks may be found on a building roof. Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.
Referencing details	The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.
Cost information notes	The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.
rateable element	Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).
non rateable element	Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).
Adjusted Plant and Machinery	Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.
Referencing details	The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.
Cost information notes	The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.
rateable element	Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).
non rateable element	Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).
Adjusted Plant and Machinery	Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Variations

Galvanised tanks require a 15% addition to Cost guide figures.

Description	Tanks Storage – Vertical. Similar to storage horizontal but, whereas the horizontal tanks are laid on cradles or structural steelwork, most vertical tanks sit on their own foundations. Flat base found in a single location or on a tank farm and can be in a tank complex or single free standing. May be supported by a skirt. They contain a variety of products but nothing under pressure. They may be steam heated or electrically heated. Made of mild steel 5mm - 6mm thick welded/bolted however depending on product stored could be produced in stainless steel/aluminium. Although small and would not normally be rated under Class 4 due to the provisions of (d) they are rateable under Class 1 or 2, irrespective of size and the accessories regarding storage of fuel for power plant or liquids for the service sections. Storage ranges 1,000-30,000 gallons. For large class 4 storage tanks see: 215A-- & 215W-- Refinery, Chemical Works and Tank Farms.
Referencing details	Diameter and height of tank together with weight in tonnes of tank (or plate thickness to enable weight to be calculated).
Cost information notes	-
rateable element	Class 1 and Class 2 Accessories (1) and (2)(v) Class 2(f) Class 4 Table 4 If Class 2 proviso applies
non rateable element	Whole if under Class 4 and Class 4(d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved without substantial demolition to surrounding structures.
Adjusted Plant and Machinery	Foundations, settings, platforms, staging for plant and machinery.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Storage ranges 1,000-30,000 gallons. For large class 4 storage tanks see: 215A-- & 215W-- Refinery, Chemical Works and Tank Farms.
Referencing details	Diameter and height of tank together with weight in tonnes of tank (or plate thick ness to enable weight to be calculated).
Cost information notes	-
rateable element	Class 1 and Class 2 Accessories (1) and (2)(v) Class 2(f) Class 4 Table 4 If Class 2 proviso applies
non rateable element	Whole if under Class 4 and Class 4(d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved without substantial demolition to surrounding structures.
Adjusted Plant and Machinery	Foundations, settings, platforms, staging for plant and machinery.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Tanks Storage – Vertical. Similar to storage horizontal but, whereas the horizontal tanks are laid on cradles or structural steelwork, most vertical tanks sit on their own foundations. Flat base found in a single location or on a tank farm and can be in a tank complex or single free standing. May be supported by a skirt. They contain a variety of products but nothing under pressure. They may be steam heated or electrically heated. Made of mild steel 5mm - 6mm thick welded/bolted however depending on product stored could be produced in stainless steel/aluminium. Although small and would not normally be rated under Class 4 due to the provisions of (d) they are rateable under Class 1 or 2, irrespective of size and the accessories regarding storage of fuel for power plant or liquids for the service sections. Storage ranges 1,000-30,000 gallons. For large class 4 storage tanks see: 215A-- & 215W-- Refinery, Chemical Works and Tank Farms.

Generic Category	Tanks
CG Code	215V60
Specific	Foundations and Settings
Descriptive	Raft base
Tech1	Mass concrete
Tech2	< 10m³
Unit size	-
Unit of measurement	m3
ERC	£769
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	To the underside of most Bulk Storage tanks is a Bit sand base (or sand base). This base will consist of (i) a compacted inert fill or oversight concrete (100mm) (ii) 150mm granular construction and (iii) a Bit sand layer. Below (I) is often a concrete slab and it is essential that details of this slab be referenced for valuation. Above ground foundations give an indication as to what is often buried below ground and if is often found that the size of the concrete foundations is in excess of what may be expected. In all circumstances the actual size from drawings should be sought however below is a simple method of estimating the size of the concrete raft if no other details are available. Take the weight of the tank and its contents. For every tonne of the steel structures adopt 2m3 of concrete.
Referencing details	1000 litres of water = 1 tonne weight 1000 litres of water = 1 cubic metre.
Cost information notes	Where the size of the concrete raft is known and the cubic metres can be calculated the cost of the re inforced concrete raft should be costed as set out in 215V60 - 63.
rateable element	Class 4 Table 3 Foundations, settings and supports.
non rateable element	-
Adjusted Plant and Machinery	Tanks
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Description	To the underside of most Bulk Storage tanks is a Bit sand base (or sand base). This base will consist of (i) a compacted inert fill or oversight concrete (100mm) (ii) 150mm granular construction and (iii) a Bit sand layer. Below (I) is often a concrete slab and it is essential that details of this slab be referenced for valuation. Above ground foundations give an indication as to what is often buried below ground and if is often found that the size of the concrete foundations is in excess of what may be expected. In all circumstances the actual size from drawings should be sought however below is a simple method of estimating the size of the concrete raft if no other details are available. Take the weight of the tank and its contents. For every tonne of the steel structures adopt 2m3 of concrete.
Referencing details	1000 litres of water = 1 tonne weight 1000 litres of water = 1 cubic metre.
Cost information notes	Where the size of the concrete raft is known and the cubic metres can be calculated the cost of the re inforced concrete raft should be costed as set out in 215V60 - 63.

Generic Category	Tanks
CG Code	215E01
Specific	Horizontal (not pressure vessels)
Descriptive	Fuel storage
Tech1	1.52m diam x 2.77m long
Tech2	6mm thick steel
Unit size	-
Unit of measurement	Each
ERC	£5,773
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks - Storage Horizontal Cigar shaped tanks found in a single location or in a tank farm above ground. Most likely external fitted with metal supports or in a frame of steel. Catwalks and platforms extra. Used mainly in the chemical/petrol industries size range 500,000 gallons but in many industrial properties used as fuel tanks for Class 1 and 2 items. Diameter and length (of the straight sections not the curved ends) should be measured for looking up the scale below but overall size required for calculating volume. Water tonnage can be calculated with reference to the scales. Made of welded/bolted mild steel but could be stainless or aluminium (see separate scales). Not pressurised. White oxide primed, hydro tested. Costs include external painting. Useful Facts (approximately) Diameter 3.25 ft x 5.5ft = 284 gallons Diameter 12 ft x 44 f = 31,100 gallons 6 ft x 4 ft x 4 f = 600 gallons 12 ft x 10 ft x 9 ft = 6,750 gallons 6 metres diameter x 6 metres = 37,400 gallons 15 metres diameter x 17 metres= 663,000 gallons.
Referencing details	Record length and diameter and capacity (gallons or litres) or m3
Cost information notes	For internal lining/painting costs see 215X series. Industrial Usage: plate thickness up to 25m3 = 6mm. 25-70m3 = 8mm. Over 70m3 6-10mm thick depending on gross volume. Horizontal cylindrical - saddle mounted not pressurised, max rating 0.4 bar. Costs exclude saddles (usually 2 steel).
rateable element	Class 2 List of Accessories (v) Class 1 List of Accessories (1) - storing of fuel for generation of power Class 4 Table 4
non rateable element	Class 2 if falls within Class 2 proviso Class 1 if not used in connection with storing of fuel for generation of power Class 4 if Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure.
Adjusted Plant and Machinery	Supports, platforms fixed gantries, staging, settings and foundations
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Tanks - Storage Horizontal Cigar shaped tanks found in a single location or in a tank farm above ground. Most likely external fitted with metal supports or in a frame of steel. Catwalks and platforms extra. Used mainly in the chemical/petrol industries size range 500,000 gallons but in many industrial properties used as fuel tanks for Class 1 and 2 items. Diameter and length (of the straight sections not the curved ends) should be measured for looking up the scale below but overall size required for calculating volume. Water tonnage can be calculated with reference to the scales. Made of welded/bolted mild steel but could be stainless or aluminium (see separate scales). Not pressurised. White oxide primed, hydro tested. Costs include external painting. Useful Facts (approximately) Diameter 3.25 ft x 5.5ft = 284 gallons Diameter 12 ft x 44 f = 31,100 gallons 6 ft x 4 ft x 4 f = 600 gallons 12 ft x 10 ft x 9 ft = 6,750 gallons 6 metres diameter x 6 metres = 37,400 gallons 15 metres diameter x 17 metres= 663,000 gallons.
Referencing details	Record length and diameter and capacity (gallons or litres) or m3
Cost information notes	For internal lining/painting costs see 215X series. Industrial Usage: plate thickness up to 25m3 = 6mm. 25-70m3 = 8mm. Over 70m3 6-10mm thick depending on gross volume. Horizontal cylindrical - saddle mounted not pressurised, max rating 0.4 bar. Costs exclude saddles (usually 2 steel).
rateable element	Class 2 List of Accessories (v) Class 1 List of Accessories (1) - storing of fuel for generation of power Class 4 Table 4
non rateable element	Class 2 if falls within Class 2 proviso Class 1 if not used in connection with storing of fuel for generation of power Class 4 if Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure.
Adjusted Plant and Machinery	Supports, platforms fixed gantries, staging, settings and foundations
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit of measurement	m3
ERC	£251
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit size	-
Unit of measurement	m3
ERC	£113
Superseded codes	215A20
Location factor	Considered Not Applicable at time of Publication
Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit of measurement	m3
ERC	£479
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit of measurement	m3
ERC	£194
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit size	-
Unit of measurement	m3
ERC	£113
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worse case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales).
Referencing details	1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. rateable element	Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

ERC	£146
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worse case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales).
Referencing details	1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales).
Referencing details	1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worse case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales).

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.
Referencing details	1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Tanks
CG Code	215A81
Specific	Large vertical
Descriptive	Refinery and Chemical works
Tech1	Fixed head
Tech2	25000m³
Unit size	Per cubic metre
Unit of measurement	m3
ERC	£90
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worse case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales).
Referencing details	1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes	These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.
rateable element	Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)
non rateable element	If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. Description	Tanks - Linings Internal Tanks are all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Usually erected on site with bit sand foundation under base plate. The whole tanks or tank plates come to site blast-cleaned and covered in a holding primer. This prevents re rusting during construction however where heat is used in welding the plates further painting is required. External and Internal linings (painting or physical linings) have to be added to each tank depending on what it is intended to hold, the provision of internal linings are undertaken by specialist paint manufacturers. The costs for EXTERNAL painting are included in the ERC. Adjustments are required if the tank is galvanised. Internal tank coatings are varied depending on the product stored. Cost Information - lining costs are similar for the various products stored in tanks. (i) Crude oil, heavy fuel, potable water, cold water, sewage water, beverages - milk and food products although having different (ii) Animal and vegetable oils, petrol and petroleum by-products Benzenes and light oils) (aliphatic and aromatic hydrocarbons) require slightly more costly linings. (iii) Aggressive acids, (vinegar) abrasive chemicals and hot water over 95°C require specialised epoxy resin primers and flaked glass in polyester to resist corrosion. (iv) Abrasive chemicals and aggressive chemicals (hydrochloric acid) require soft natural rubber, butyl soft rubber or hard ebonite to resist the product damaging the tank.
Referencing details	Needs internal volume of tank in m3 and operating temperature as well as nature of contents which will determine the type of lining
Cost information notes	Costs assume that the occupier has several tanks that require painting and takes account of the contractor on costs in planning and providing site services to the painting contractor. Where there is clearly a mixture of tank uses, as on a commercial tank farm variations in tank internal painting should be reflected. Costs do not include for bits and foundations, concrete/pile foundations, heating coils, insulation (rock wool), ladders, catwalks etc. These costs assume the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series

Cost information notes	Costs assume that the occupier has several tanks that require painting and takes account of the contractor on costs in planning and providing site services to the painting contractor. Where there is clearly a mixture of tank uses, as on a commercial tank farm variations in tank internal painting should be reflected. Costs do not include for bits and foundations, concrete/pile foundations, heating coils, insulation (rock wool), ladders, catwalks etc. These costs assume the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series
rateable element	Tanks: Class 4, Table 4 Class 4(b) Integral part of the tank structure
non rateable element	-

Adjusted Plant and Machinery	Foundations, catwalks, bunds. Deep piles. Fire protection equipment.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Generic Category	Tanks
CG Code	215X20
Specific	Linings
Descriptive	Rubber, Butyl or hard Ebony
Tech1	Very aggressive products
Tech2	751m³ - 2,750m³ tank volume
Unit size	-
Unit of measurement	m3
ERC	£132
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks - Linings Internal Tanks are all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Usually erected on site with bit sand foundation under base plate. The whole tanks or tank plates come to site blast-cleaned and covered in a holding primer. This prevents re rusting during construction however where heat is used in welding the plates further painting is required. External and Internal linings (painting or physical linings) have to be added to each tank depending on what it is intended to hold, the provision of internal linings are undertaken by specialist paint manufacturers. The costs for EXTERNAL painting are included in the ERC. Adjustments are required if the tank is galvanised. Internal tank coatings are varied depending on the product stored. Cost Information - lining costs are similar for the various products stored in tanks. (i) Crude oil, heavy fuel, potable water, cold water, sewage water, beverages - milk and food products although having different (ii) Animal and vegetable oils, petrol and petroleum by-products Benzenes and light oils) (aliphatic and aromatic hydrocarbons) require slightly more costly linings. (iii) Aggressive acids, (vinegar) abrasive chemicals and hot water over 95°C require specialised epoxy resin primers and flaked glass in polyester to resist corrosion. (iv) Abrasive chemicals and aggressive chemicals (hydrochloric acid) require soft natural rubber, butyl soft rubber or hard ebonite to resist the product damaging the tank.
Referencing details	Needs internal volume of tank in m3 and operating temperature as well as nature of contents which will determine the type of lining.
Cost information notes	Costs assume that the occupier has several tanks that require painting and takes account of the contractor on costs in planning and providing site services to the painting contractor. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (rock wool), ladder

Generic Category	Tanks
CG Code	215X04
Specific	Linings
Descriptive	Painted Linings to Steel Tanks
Tech1	Crude Oil, Water, and Sewage
Tech2	7,001m³ - 15,000m³ tank volume
Unit size	-
Unit of measurement	m3
ERC	£26
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks - Linings Internal Tanks are all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Usually erected on site with bit sand foundation under base plate. The whole tanks or tank plates come to site blast-cleaned and covered in a holding primer. This prevents re rusting during construction however where heat is used in welding the plates further painting is required. External and Internal linings (painting or physical linings) have to be added to each tank depending on what it is intended to hold, the provision of internal linings are undertaken by specialist paint manufacturers. The costs for EXTERNAL painting are included in the ERC. Adjustments are required if the tank is galvanised. Internal tank coatings are varied depending on the product stored. Cost Information - lining costs are similar for the various products stored in tanks. (i) Crude oil, heavy fuel, potable water, cold water, sewage water, beverages - milk and food products although having different (ii) Animal and vegetable oils, petrol and petroleum by-products Benzenes and light oils) (aliphatic and aromatic hydrocarbons) require slightly more costly linings. (iii) Aggressive acids, (vinegar) abrasive chemicals and hot water over 95°C require specialised epoxy resin primers and flaked glass in polyester to resist corrosion. (iv) Abrasive chemicals and aggressive chemicals (hydrochloric acid) require soft natural rubber, butyl soft rubber or hard ebonite to resist the product damaging the tank.
Referencing details	Needs internal volume of tank in m3 and operating temperature as well as nature of contents which will determine the type of lining
Cost information notes	Costs assume that the occupier has several tanks that require painting and takes account of the contractor on costs in planning and providing site services to the painting contractor. Where there is clearly a mixture of tank uses, as on a commercial tank farm variations in tank internal painting should be reflected.
rateable element	Tanks: Class 4, Table 4 Class 4(b) Integral part of the tank structure
non rateable element	-
Adjusted Plant and Machinery	Foundations, catwalks, bunds. Deep piles. Fire protection equipment.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. (iii) Aggressive acids, (vinegar) abrasive chemicals and hot water over 95°C require specialised epoxy resin primers and flaked glass in polyester to resist corrosion. (iv) Abrasive chemicals and aggressive chemicals (hydrochloric acid) require soft natural rubber, butyl soft rubber or hard ebonite to resist the product damaging the tank. Costs do not include for bits and foundations, concrete/pile foundations, heating coils, insulation (rock wool), ladders, catwalks etc. These costs assume the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting see 215X series
rateable element	Tanks: Class 4, Table 4 Class 4(b) Integral part of the tank structure
non rateable element	-
Adjusted Plant and Machinery	Tanks
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

The tanks situated within Refineries and large Chemical Works are sometimes called BULLETS and are shaped like a cigar: tube shaped, having rounded ends. They are made from mild steel but can be stainless and some are lined depending upon the type of material held. Tubes can be made from other smaller tubes welded together on site and tested for faults in weld.

Pressures may be just above Atmosphere or up to 200 psig. The thickness of steel will generally be more than 25mm and consequently the tank is very heavy (even small ones) the supports and foundations will be large to hold this weight. The thickness of steel and the pressure testing increases the cost as does the on site time for installation.

Description

They hold many substances including unstable crude oil, helium, oxygen and LPG in general. Propane and Butane stored in smaller tanks is often used for power or heat purposes and thus may be rateable under Class 1 or Class 2.

The main application for this type of tank is storing smaller quantities of a product. Bulk quantities would be kept in a Horton Sphere: See code series 215B - -.

In general Industrial hereditaments smaller pressure tanks are common. Those holding compressed air in conjunction with air compressors are more specifically costed under Air: Receivers. See code series 201B - -.

Location factor	Considered Not Applicable at time of Publication
Description	The tanks situated within Refineries and large Chemical Works are sometimes called BULLETS and are shaped like a cigar: tube shaped, having rounded ends. They are made from mild steel but can be stainless and some are lined depending upon the type of material held. Tubes can be made from other smaller tubes welded together on site and tested for faults in weld. Pressures may be just above Atmosphere or up to 200 psig. The thickness of steel will generally be more than 25mm and consequently the tank is very heavy (even small ones) the supports and foundations will be large to hold this weight. The thickness of steel and the pressure testing increases the cost as does the on site time for installation. They hold many substances including unstable crude oil, helium, oxygen and LPG in general. Propane and Butane stored in smaller tanks is often used for power or heat purposes and thus may be rateable under Class 1 or Class 2.
Referencing details	Industrial Usage Medium Pressure Horizontal cylindrical - saddle mounted 16 Bar Temp Range - 10C to + 50C
Cost information notes	-
rateable element	Tanks - Class 4, Table 4 Class 1 List of Accessories (1) - storing of fuel for generation of power. Tanks Class 2(b) Heating list of accessories Tanks
non rateable element	Whole if under Class 4 the Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure Whole under Class 2 "other than 85"
Adjusted Plant and Machinery	Stairways, fire protection, staging, foundations.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Tanks Spheres Looking like a golf ball on a tee these tanks are often referred to as Horton Spheres, named after one of the major manufacturers of these tanks. This tank design used when large quantities of liquid under pressure are required to be stored and are most common in Refineries or large Chemical Works. Where natural gas is not piped to properties or where pure gas of a specific type is required by the manufacturer a single tank may be employed. The tank has to withstand high pressures and often low temperatures (i.e. up to 1000 psig and down to 253Oc) and this results in steel of 25 mm thickness or greater. (Normal thickness is 28 mm for pressures up to 250 psig). The weight of the sphere is high and this is reflected in the size of the leg supports and foundations. When storing liquids that are corrosive specialist alloys or stainless steel is used in the sphere's construction. Alternatively, a specialised lining (such as fibre glass) may be employed.
Referencing details	Weight of steel = 205.5 kg/m2 per 25 mm thick. Although these spheres are low pressure the thickness of steel in the plates increases due to the increase in the volume of the structure.
Cost information notes	To calculate the cost of a sphere: (a) The diameter to calculate the surface area (4 x 22/7 x r2) (b) The thickness of the plate in mm * (c) Conversion factor 7.85 kg. mm thickness / sq m (d) Cost per tonne of steel Cost excludes supports and foundations Cost = surface area x thickness in mm x 7.85 / 1000 x cost of steel * Low pressure 14 to 18 mm: if not known adopt 16 mm Low pressure 22 to 28 mm: if not known adopt 25 mm High pressure 28 to 38 mm: if not known adopt 35 mm
rateable element	Class 4 Table 4 Tanks (note Class 4 (d)) Class 4 Table 3 Supports (legs) Class 4 Table 3 Foundations.
non rateable element	-
Adjusted Plant and Machinery	Stairways, fire protection, staging, foundations.

This tank design used when large quantities of liquid under pressure are required to be stored and are most common in Refineries or large Chemical Works. Where natural gas is not piped to properties or where pure gas of a specific type is required by the manufacturer a single tank may be employed. The tank has to withstand high pressures and often low temperatures (i.e. up to 1000 psig and down to 253Oc) and this results in steel of 25 mm thickness or greater. (Normal thickness is 28 mm for pressures up to 250 psig). The weight of the sphere is high and this is reflected in the size of the leg supports and foundations. When storing liquids that are corrosive specialist alloys or stainless steel is used in the sphere's construction. Alternatively, a specialised lining (such as fibre glass) may be employed.
Referencing details	Weight of steel = 205.5 kg/m2 per 25 mm thick. Although these spheres are low pressure the thickness of steel in the plates increases due to the increase in the volume of the structure.
Cost information notes	To calculate the cost of a sphere: (a) The diameter to calculate the surface area (4 x 22/7 x r2) (b) The thickness of the plate in mm * (c) Conversion factor 7.85 kg. mm thickness / sq m (d) Cost per tonne of steel Cost excludes supports and foundations Cost = surface area x thickness in mm x 7.85 / 1000 x cost of steel * Low pressure 14 to 18 mm: if not known adopt 16 mm Low pressure 22 to 28 mm: if not known adopt 25 mm High pressure 28 to 38 mm: if not known adopt 35 mm
rateable element	Class 4 Table 4 Tanks (note Class 4 (d)) Class 4 Table 3 Supports (legs) Class 4 Table 3 Foundations.
non rateable element	-
Adjusted Plant and Machinery	Stairways, fire protection, staging, foundations.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	To calculate the cost of the legs: (a) The weight of the legs in tonnes x cost per tonne of steel.

The tank has to withstand high pressures and often low temperatures (i.e. up to 1000 psig and down to 253Oc) and this results in steel of 25 mm thickness or greater. (Normal thickness is 28 mm for pressures up to 250 psig). The weight of the sphere is high and this is reflected in the size of the leg supports and foundations. When storing liquids that are corrosive specialist alloys or stainless steel is used in the sphere's construction. Alternatively, a specialised lining (such as fibre glass) may be employed.
Referencing details	Weight of steel = 205.5 kg/m2 per 25 mm thick. Although these spheres are low pressure the thickness of steel in the plates increases due to the increase in the volume of the structure.
Cost information notes	To calculate the cost of a sphere: (a) The diameter to calculate the surface area (4 x 22/7 x r2) (b) The thickness of the plate in mm * (c) Conversion factor 7.85 kg. mm thickness / sq m (d) Cost per tonne of steel Cost = surface area x thickness in mm x 7.85 / 1000 x cost of steel * Low pressure 14 to 18 mm: if not known adopt 16 mm Low pressure 22 to 28 mm: if not known adopt 25 mm High pressure 28 to 38 mm: if not known adopt 35 mm
rateable element	Class 4 Table 4 Tanks (note Class 4 (d)) Class 4 Table 3 Supports (legs) Class 4 Table 3 Foundations.
non rateable element	-
Adjusted Plant and Machinery	Stairways, fire protection, staging, foundations.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)
Variations	To calculate the cost of the legs: (a) The weight of the legs in tonnes x cost per tonne of steel.

Unit size	-
Unit of measurement	Each
ERC	£17,531
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	This type of tank is usually intended for processed product storage and normally does not exceed 25,000 cu m in volume. They may hold contain either food products (e.g. milk, beer) or aggressive chemicals like dilute acids or alkalis. Such tanks are usually found on commercial tank farms together with individual tanks or clusters of tanks on a range of industrial sites, including chemical works, food manufacturing and breweries. Generally all stainless steel, these tanks are similar in construction and design to mild steel fixed-head tanks. However, their weight pro rata to steel thickness is greater and careful referencing of foundation detail is required. They are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base. The costs provided in this Cost Guide are for fixed head tanks - roofs are conical or domed and self-supporting, being made of 5 mm stainless steel plates welded at the edges. These tanks are usually purpose designed by the operator and built to their specification. The design life is at minimum 30 years , so whilst they are initially more expensive to purchase than equivalent mild steel tanks their maintenance costs are lower. Stainless steel contains a high percentage of nickel, the market price of which will often vary according to a pattern different from that of steel. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use, whilst any of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably . Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid storage tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical tank in this

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation, structural stairways, catwalks, between tank walkways, et cetera. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	Cost Information Notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2 (v)
non rateable element	If Class 2 proviso applies Whole if under Class 4 and Class 4(d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved without substantial demolition to surrounding structures.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2 (v)
non rateable element	If Class 2 proviso applies Whole if under Class 4 and Class 4(d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved without substantial demolition to surrounding structures.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Descriptive	Stainless Steel; SS304 = Mixed Products
Tech1	Flat Bottom; 5mm plate
Tech2	3.82m diam x 9.4m ht x 5.45 tonnes
Unit size	-
Unit of measurement	Each
ERC	£134,080
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	This type of tank is usually intended for processed product storage and normally does not exceed 25,000 cu m in volume. They may hold contain either food products (e.g. milk, beer) or aggressive chemicals like dilute acids or alkalis. Such tanks are usually found on commercial tank farms together with individual tanks or clusters of tanks on a range of industrial sites, including chemical works, food manufacturing and breweries. Generally all stainless steel, these tanks are similar in construction and design to mild steel fixed-head tanks. However, their weight pro rata to steel thickness is greater and careful referencing of foundation detail is required. They are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base. The costs provided in this Cost Guide are for fixed head tanks - roofs are conical or domed and self-supporting, being made of 5 mm stainless steel plates welded at the edges. These tanks are usually purpose designed by the operator and built to their specification. The design life is at minimum 30 years , so whilst they are initially more expensive to purchase than equivalent mild steel tanks their maintenance costs are lower. Stainless steel contains a high percentage of nickel, the market price of which will often vary according to a pattern different from that of steel. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use, whilst any of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably . Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid storage tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical tank in this

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation, structural stairways, catwalks, between tank walkways, et cetera. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	Cost Information Notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit of measurement	m3
ERC	£906
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit size	Per cubic metre
Unit of measurement	m3
ERC	£273
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

ERC	£504
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 provision applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 provision applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Unit size	Per cubic metre
Unit of measurement	m3
ERC	£275
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is

Referencing details	Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.
Cost information notes	The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.
rateable element	Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.
non rateable element	If under Class 2, whole if Class 2 provision applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.
Adjusted Plant and Machinery	Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. Unit size	m2
Unit of measurement	m2
ERC	£935
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Indoor Tennis block based on the MODERN DAY EQUIVALENT. SINGLE STOREY - Construction specification includes Reinforced Concrete beam foundations with some retaining walls, steel frame, specialist sub-base, metal cladding (incl roof lights), elements of curtain walling (rain screen cladding) albeit other doors are metal louvered PCC. Internally the walls will be plastered with the exception of the courts which are painted black. Floor finishes include carpet vinyl with an acrylic surface in places. Ceilings are a mixture of plasterboard MF suspended ceilings to non court areas. Cubicles will be provided as part of the FFE. Services include sanitary ware, gas LTHW central heating, cooling ventilation, electrics, alarms, CCTV, data cables building maintenance system. An allowance for roller Shutters has also been included. This specification is reflective of the community use facilities being constructed by Local Authorities and private clubs open to the public. Specification differences are not uncommon thus a figure 10% either way should be anticipated. However, due to the high level of M&E installed in this beacon, where the facility is constructed at a small club level where BMS, cooling data cabling has not been installed, specification differences of 10-15% should be expected. Please note : Whilst the tennis hall part of the building will be a single storey building, it will be a double height - circa 6.0m.
Referencing details	-
Cost information notes	All costs exclude External Works.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	The plant and machinery listed in the description has been included in this costing
Number of items adjusted	-

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

ERC	£958
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Indoor Tennis block based on the MODERN DAY EQUIVALENT. TWO STOREY (In part) - Construction specification include RC beam foundations with some retaining walls, steel frame specialist sub-base, metal cladding (incl roof lights), elements of curtain walling (rain screen cladding) albeit other doors are metal louvered PCC. Precast upper floors (incl screed). Internally the walls will be plastered with the exception of the courts which are painted black. Floor finishes include carpet vinyl with an acrylic surface in places. Ceilings are a mixture of plasterboard MF suspended ceilings to non court areas. Cubicles will be provided as part of the FFE. Services include sanitary ware, gas LTHW central heating, cooling ventilation, electrics, alarms, CCTV, data cables building maintenance system. A Lift has been included. The rate includes an allowance for roller Shutters. This specification is reflective of the community use facilities being constructed by local authorities private clubs open to the public. Specification differences are not uncommon thus a figure 10% either way should be anticipated. However, due to the high level of M&E installed in this beacon, where the facility is constructed at a small club level where BMS, cooling data cabling has not been installed, specification differences of 10-15% should be expected. Due to the specification and similarity in terms of construction e.g. flooring and glazed screen provision etc., the rate stated would permit either a second floor viewing gallery or a cat A fit out of a fitness suite. No loose FFE or fitness equipment would be included in the rate. Please note : Whilst the tennis centre is 2 storey, the actual tennis hall is likely to be a single storey of double height i.e. circa 6m tall.

Description	Please note this is a modern day equivalent and reflects a sustainable specification which is currently being constructed in most modern day facilities. Construction: Excavation (topsoil / sub-base), with disposal off site. Geotextile membrane with 150mm Type 1 stone. Final surface (laid by hand); 65mm porous macadam (40mm depth with 20mm nominal aggregate / 25mm depth with 6mm aggregate). Precast concrete edging. Rate includes 2.75mm weld mesh fencing - 2.75m high including posts set into concrete (1 single gate). Perimeter soak away drainage with a catch pit solid pipe to outfall (allowance of 20m).
Referencing details	-
Cost information notes	The cost does not include any allowance of drainage attenuation and it is assumed a permanent drainage connection will be within 20m of the edge of the site. It is assumed a relatively level site has been used, thus extensive cut fill will not be included within the figure.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Variations If constructed to Sport England standard for Tennis Courts (as opposed to SEPCA), it is noted they require 300mm Type 3 sub-base. The different sub-base specification increases the cost udsing code 53U30V1. Type 3 is a free draining material required under hard surfaces and complies with SUDS requirements.

Description	The dome consists of a pre-tailored polythene membrane, which is anchored around a perimeter concrete foundation (not included in the rate). The membrane is secured by a network of plastic-coated wired ropes which is also connected to the foundation. The rope network relieves the membrane of most of the stresses and strains when the structure is inflated. If ground conditions permit, a series of ground anchors can be used in lieu of the foundation, although this method is slightly more expensive than the ring beam. The dome is inflated by two 300mm diameter centrifugal fans with 240V single phase motors. These are mounted in fibreglass cabinets. One fan is adequate to support the facility in normal operating conditions, although a second fan is required in high winds. As the dome is a single membrane with no insulation, it is not cost effective to heat, although space heaters may be used during winter to melt the snow. (The cost of this is excluded). Due to the transparent membrane, lights are not provided during daylight hours. Standard outdoor floodlighting (Excluded but separate code exists) provides adequate penetration for night play. Internal lights are not recommended due to the significant damage caused by unexpected deflation. Cost includes supply installation of the membrane, steel cable network. One revolving door, 2 fans with control panel anemeter and anchor fixings. A 12 backup generator has been included. Foundation, electrical installation / upgrade, storage, playing surfaces, external works, drainage and fuel for the generator are EXCLUDED.
Referencing details	-
Cost information notes	The cost to provide a concrete ring beam support is noted in a separate code.
rateable element	-
non rateable element	-

Description	The dome consists of a pre-tailored polythene membrane, which is anchored around a perimeter concrete foundation. The membrane is secured by a network of plastic-coated wired ropes which is also connected to the foundation. The rope network relieves the membrane of most of the stresses and strains when the structure is inflated. If ground conditions permit, a series of ground anchors can be used in lieu of the foundation, although this method is slightly more expensive than the ring beam. The dome is inflated by two 300mm diameter centrifugal fans with 240V single phase motors. These are mounted in fibreglass cabinets. One fan is adequate to support the facility in normal operating conditions, although a second fan is required in high winds. As the dome is a single membrane with no insulation, it is not cost effective to heat, although space heaters may be used during winter to melt the snow (the cost of this is excluded). Due to the transparent membrane, lights are not provided during daylight hours. Standard outdoor floodlighting (excluded but separate code exists) provides adequate penetration for night play. Internal lights are not recommended due to the significant damage caused by unexpected deflation. The foundation is a continuous ring beam, approx. size 650mm x 650mm (although ground conditions can alter dimensions to 500mm - 750mm), Grade C35 concrete. The surface should have towelled finish to facilitate the air seal with the inner membrane flap. The beam will have a slight outward fall to prevent rainwater running into the dome. The anchor fittings are drilled once the concrete has set.
Referencing details	-
Cost information notes	Cost includes both the dome and a ring beam foundation

non rateable element	-

Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
Variations	Entry to the dome is via a self supporting steel revolving door which minimises air escape. A separate 2m x 1m steel door can be added to assist with disabled access at an addition of code 53U15V3

Description	A cable dome is a permanent or temporary structure consisting of a PVC membrane, strengthened by steel cables and inflated by a continuous running fan. It is held up by negative air pressure within. In the case of a cable dome, a membrane with a net of steel cables for strength is placed over the area to be covered and then inflated by a fan that must remain running. There are no supporting structures. Entry to the dome is via a revolving door or a set of double airlock doors. Domes can be linked together to provide a specific court layout. Main membrane - polyester fabric coated with PVS on both sides. It can be green up to a height of 3-4m for good ball visibility with a translucent white fabric on the roof area to let in natural light. Thermal insulation: A 10mm thick translucent layer of polyurethane insulation is placed on top of the main membrane to provide an efficient thermal barrier to keep in heat and conserve energy. Protective Foil: Polyurethane foil is placed on top of the insulation layer to provide protection for the main membrane against the steel cables, pollution and dirt. Steel galvanised nets: A net of galvanised steel rope is lain in the sandwich of membranes providing a strong cover that mounds the shape of the inflated membranes takes up most of the stress. The foundation is a continuous ring beam, approx. size 650mm x 650mm (although ground conditions can alter dimensions to 500mm - 750mm), Grade C35 concrete. The surface should have towelled finish to facilitate the air seal with the inner membrane flap. The beam will have a slight outward fall to prevent rainwater running into the dome. The anchor fittings are drilled once the concrete has set.
Referencing details	-
Cost information notes	The cost includes supply, installation delivery of the dome. Please note the cost to provide a weatherproof housing for the plant, the provision of a three phase electrical supply, gas or oil supply are EXCLUDED from the above cost. The rate also EXCLUDES any external works (except foundation), playing surface, fencing or drainage.

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Tech1	-
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£898
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	The scale of the facility and support accommodation will depend upon the size of the sports hall and the extent of other activities to be included as part of the facility. For instance sports halls may be combined with swimming pools, ice rinks, etc. as part of a larger sports and leisure facility. Each project will have its own requirements, but every freestanding sports hall should have: Foyer and reception, Refreshment area, Changing and toilet accommodation, Facilities for disabled people, Office accommodation, Integral equipment storage, Hall viewing with seating, Provision for first aid, Plant room, Cleaners store. Facility will include hot air blown heating for thermal comfort and good lighting provisions.
Referencing details	Cost to be applied to the tennis hall GIFA not the tennis centre area
Cost information notes	Cost applies to tennis hall function as opposed to a composite tennis centre - See Tennis Centres.

Referencing details	Measure external dimensions of fencing or walls. Note number of transformers. Do not enter compound. If access is restricted and measurements are not possible use lump sum figure for number of transformers (Code 44510G)
Cost information notes	Excludes transformers Includes foundations, gravel or concrete base, fencing or walls to 1.8m height, gates and all within the compound area.
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Uninterrupted power supply
CG Code	200B01
Specific	Rotary
Descriptive	Maintains full system power.
Tech1	415V
Tech2	UPS output kw [E] 120
Unit size	-
Unit of measurement	Each
ERC	£105,106
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	A rotary flywheel Uninterruptible Power Supply (UPS) uses a constantly spinning flywheel powered from the mains to store sufficient (kinetic) energy to instantly generate electrical power if the main supply fails, for a short period whilst a conventional diesel generator runs up to speed.
Referencing details	Key identifying factors: Static or Rotary UPS Power Rating (in kW or kVA) Battery Run/autonomy time. Battery in matching cubicles or on racks
Cost information notes	Cost includes the diesel generator assumed to be 414 volt / 50HZ
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.
Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Description	Rotary Flywheel Power - Alternating Current (AC) comes in and passes through a Rectifier and is converted to Direct Current (DC). The DC current charges up batteries. The current then runs a rotary flywheel, which is a heavy spinning wheel. The wheel turns a shaft, which then turns an alternator producing AC current. After the alternator there is often a thyristor to regulate the current. Before the batteries is a diesel generator (often a DC generator). The batteries are in batches of 128 and are usually 2 volts. (The life of a battery if well-maintained will be 8 years) The running time is approximately 10 minutes. When the mains fail the mains fail device starts the diesel alternator. In the interim the block of batteries maintain the current and the rotary flywheel continues turning and generating. The millisecond before the batteries come in the flywheel is free running but due to its weight it keeps turning and generating and thus there is no loss of power to the main system. After 1 minute the diesel engine will be at full capacity and will take over from the batteries in supplying the flywheel with power. It will also re-charge the batteries. The diesel generator will run for approximately 48 hours giving enough time for the mains supply to be restored.
Referencing details	Key identifying factors: Static or Rotary UPS Power Rating (in kW or kVA) Battery Run/autonomy time Battery in matching cubicles or on racks
Cost information notes	Cost does not include battery banks, rectifier, inverter or thyristor but does include the diesel generator. It is assumed that the voltage is 415 V (unless stated differently) at 50 hz
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment	(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Unit of measurement	m
ERC	£31
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Pre-cast concrete coping 305 X 76mm to brick (215mm wall).
Referencing details	-
Cost information notes	-
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Waste Storage Bunker
CG Code	42W01C
Specific	RF Concrete bunker above ground
Descriptive	Bunker structure only
Tech1	Less than 1,000m3 Volume
Tech2	-
Unit size	-
Unit of measurement	m3
ERC	£170
Superseded codes	-
Location factor	Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00
Description	Commonly found in the reception halls of Energy from Waste Plants.. Purpose of the bunker is to provide waste storage capacity above ground but below the tipping floor. The bunker is constructed in a single pour, walls 0.5m thick. Housed within main structure of the waste facility to minimise the escape of odours. Overhead grab cranes used to mix and break up the incoming waste, to ensure homogeneity of feed to the combustion chambers. Volume of the bunker is >1000m3
Referencing details	Internal Volume & adjusted for wall thickness
Cost information notes	Bunker construction only included
rateable element	-
non rateable element	-
Adjusted Plant and Machinery	-
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.

Generic Category	Weighbridges
CG Code	3000Q1
Specific	Electric Load Cells
Descriptive	Concrete Base
Tech1	With raised ends or shallow pit
Tech2	-
Unit size	-
Unit of measurement	m2
ERC	£9,638
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Cost is for housing or settings. Electric weighbridges and weigh beams operate by load cells resting on over site concrete. Weighbridges are generally 3 metres wide and 12 to 15 metres long: a 450mm depth is required below the weighbridge to house the load cells. This may be achieved by a shallow pit or, more usually, by the use of access ramps and a flat concrete approach at each end to a raised plate level. Weighing capacity is usually 20,30,40 or 50 tonnes.
Referencing details	Overall size of pit or individual cell support blocks Weighbridge plates are generally 3 m wide and between 12 - 15 m long. These are not rateable it is the supports, settings and founds to them that are Class 4.
Cost information notes	-
rateable element	Supports, settings and founds together with access ramps
non rateable element	Weighbridge plates
Adjusted Plant and Machinery	Ramped access - concrete , steel or tarmac. Control cabins or kiosks
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. Generic Category	Weighbridges
CG Code	3000Q7
Specific	Mechanical within pit
Descriptive	Railway
Tech1	Less than 1.2m Depth
Tech2	20 Tonnes
Unit size	-
Unit of measurement	Each
ERC	£7,334
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Cost is for the pit that houses the mechanical weighing equipment on which a metal plate and rail track sits. Pits normally have a depth of up to 1.2m and the length and width of the plate will depend on the size of the rolling stock. The pit is required below the weighbridge to house the mechanical load cells. Weighing capacity is usually up to 20 tonnes.
Referencing details	Overall size of pit
Cost information notes	-
rateable element	Supports, settings and founds
non rateable element	Weighbridge plates
Adjusted Plant and Machinery	Control cabins or kiosks
Number of items adjusted	-
Contract size adjustment	(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Generic Category	Weighbridges
CG Code	3000Q2
Specific	Weigh Beams
Descriptive	Pit for Each individual beam
Tech1	With concrete or tarmac between individual pits
Tech2	-
Unit size	-
Unit of measurement	Each
ERC	£610
Superseded codes	-
Location factor	Considered Not Applicable at time of Publication
Description	Weigh beams are generally 3 metres wide and 750mm long; a 275mm deep box is set in the concrete or tarmac paving to house the beams. Cost is for housing or settings. Instead of having a large plate a series of Weigh beams are normally installed. A 275mm deep box is set in the concrete or tarmac paving to house the beams & over a length of 15 m there may be 4 or 5 beams. Within each pit is set the electrical cells on which a steel plate sits. The cost of a single box / pit is given but additions are required for the concrete / tarmac area between them , which is often re-enforced.
Referencing details	Overall size of pit or individual cell support blocks
Cost information notes	For cost of concrete between pits see Item Code 300065
rateable element	Supports, settings and founds together with access ramps
non rateable element	Weighbridge plates
Adjusted Plant and Machinery	Ramped access - concrete , steel or tarmac. Control cabins or kiosks
